7 In der Praxis ist es besser, sie zufällig zu wählen, um lokale Maxima zu vermeiden.

page 1

7 In der Praxis ist es besser, sie zufällig zu wählen, um lokale Maxima zu vermeiden.

$$\frac{1}{2} \cdot \frac{1}{2} = 0.03125$$

Die Wahrscheinlichkeit, dass alle acht Bonbons verschiedene Sorten sind, ist also 0,03125. Allerdings kann es auch passieren, dass mehrere Bonbons dieselbe Sorte haben. Um dies zu berechnen, müssen wir die Bezeichnungen der beiden Tische wechseln. Betrachten wir die Bezeichnungen der Tische als Zählelemente. Wenn wir 10000 Stichproben aus einem Modell erzeugt, dessen tatsächliche Parameterwerte $\theta_1 = \theta_3 = \theta_5 = \theta_7 = 0.8$, $\theta_2 = \theta_4 = \theta_6 = \theta_8 = 0.3$, was folgt:

(20.7) $P(\text{alle acht Bonbons sind unterschiedliche Sorten}) = \frac{8!}{(0.8^8)(0.3^8)} \cdot \frac{1}{8!} = 0.03125$

Das bedeutet, die Bonbons können mit derselben Wahrscheinlichkeit aus jeder der vier Tische entnommen werden. Wenn wir die ersten vier Bonbons mit Kirschenbons mit rotem Eispüdding und den letzten vier mit Zitronenbons mit grünem Eispüdding einnehmen, in der ersten Reihe befinden sich hauptsächlich Zitronenbons mit rotem Eispüdding, in der zweiten Reihe hauptsächlich Kirschenbons mit grünem Eispüdding. Das ist kein Loser! Die Zähler für die acht möglichen Bonbonarten sehen wie folgt aus:

$$10000 \cdot 0.7^8 \cdot 0.3^8 \cdot 0.7^8 \cdot 0.3^8 \cdot 0.7^8 \cdot 0.3^8 = 0.22999$$

Wir schließen, dass die Nominalverteilung eine bessere Verteilung ist.

Überprüfen wir eine Beziehung von θ^2 auf θ^4 . Durch Anwendung der Formel für die Varianz erhalten wir eine Beziehung von

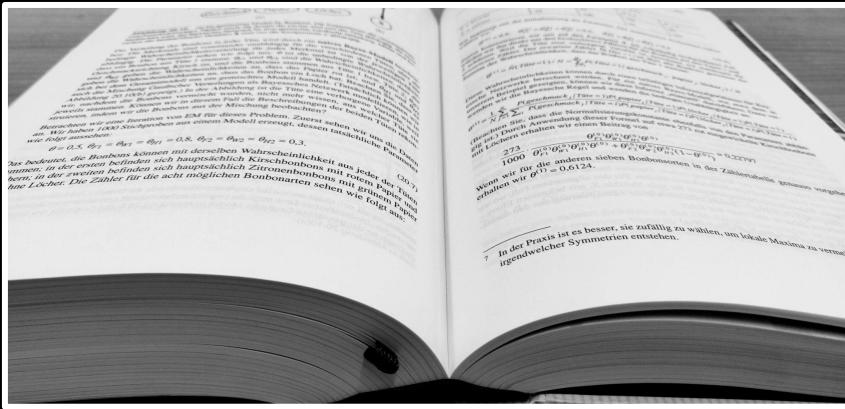

$$2 \cdot \frac{1}{2} = 0.03125$$

Wir schließen, dass die Nominalverteilung eine bessere Verteilung ist.

Überprüfen wir eine Beziehung von θ^2 auf θ^4 . Durch Anwendung der Formel für die Varianz erhalten wir eine Beziehung von

$$2 \cdot \frac{1}{2} = 0.03125$$

Wir schließen, dass die Nominalverteilung eine bessere Verteilung ist.

7 In der Praxis ist es besser, sie zufällig zu wählen, um lokale Maxima zu vermeiden.

Betrachten wir die Ergebnisse vom EM für dieses Problem. Zunächst sehen wir uns die Parameterwerte an, die das Modell erzeugt, dessen tatsächliche Parameterwerte folgen:

Die Bonbons können mit derselben Wahrscheinlichkeit aus jeder der vier Sorten entnommen werden. Das heißt, wenn wir z.B. einen Karamellbonbon mit rotem Löffel nehmen, in der ersten Reihe befinden sich hauptsächlich Zitronenbonbons mit rotem Löffel, in der zweiten befinden sich hauptsächlich Zitronenbonbons mit grünem Löffel. Die Zähler für die acht möglichen Bonbonarten seien wie folgt angegeben:

Es folgt also $\theta_{01} = \theta_{02} = 0.8$, $\theta_{11} = \theta_{12} = 0.3$.

Wir schätzen die Nominierungswahrscheinlichkeit eines Zitronenbonbons mit grünem Löffel, $\hat{\theta}_{11}$, an. Nach der Schätzung des EM erhalten wir eine Beziehung von

$$\frac{2}{1000} \cdot \theta_{11}^2 \cdot \theta_{01}^2 \cdot \theta_{12}^2 \cdot \theta_{02}^2 = \frac{2}{1000} \cdot \hat{\theta}_{11}^2 \cdot 0.8^2 \cdot 0.3^2 \cdot 0.8^2 = 0.22799$$

Wegen der Annahme, dass die Nominierungswahrscheinlichkeit eines Zitronenbonbons mit grünem Löffel, $\hat{\theta}_{11}$, gleich ist der tatsächlichen Wahrscheinlichkeit, erhalten wir $\hat{\theta}_{11} = 0.6124$.

place value systems

$$N = d_n * R^{n-1} + \dots + d_2 * R^1 + d_1 * R^0$$

$$d \in \{ 0, 1, \dots R-1 \}$$

n = number of digits

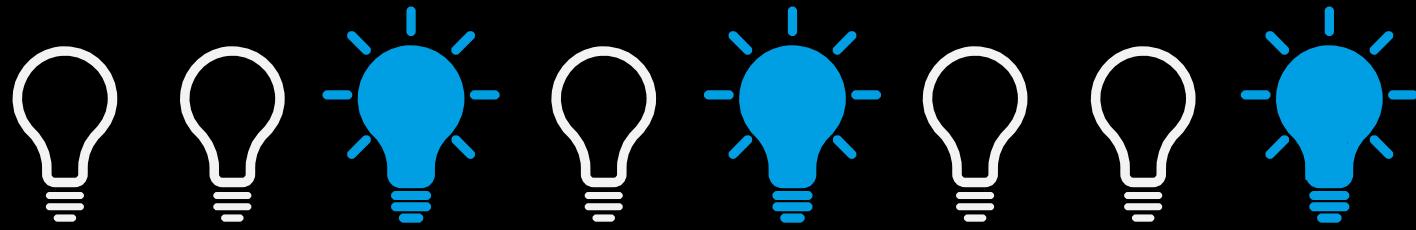

R = base

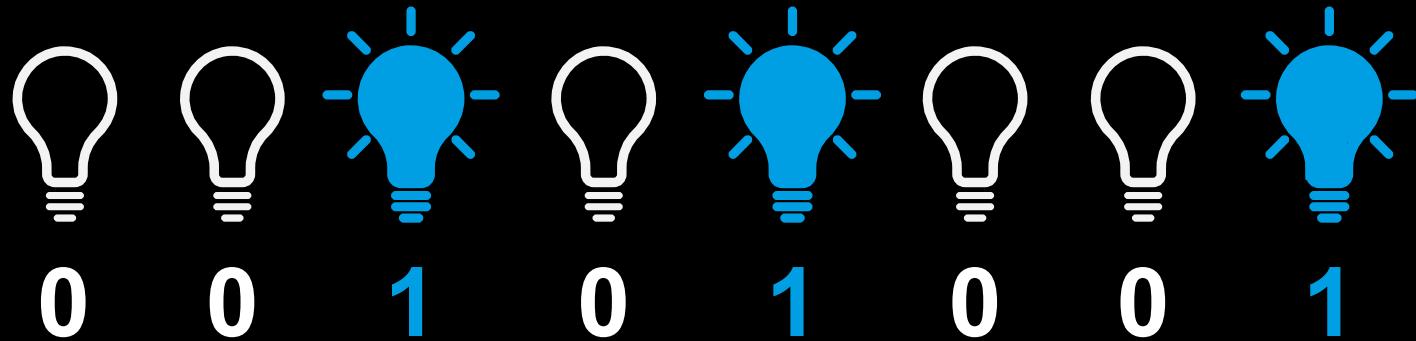

$R \geq 2$

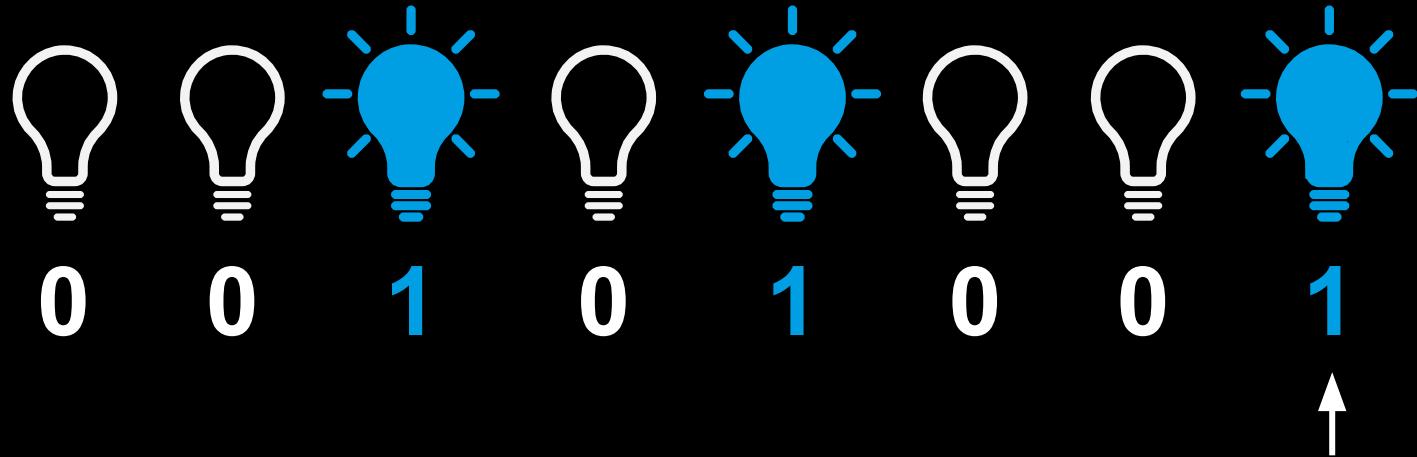

BITS

why do computers think binary?

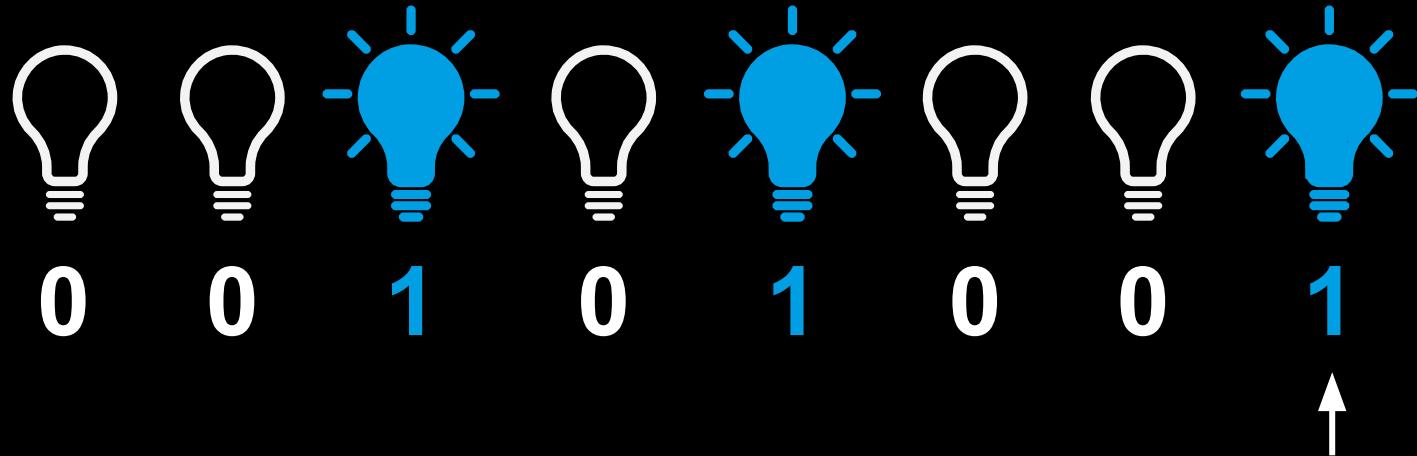

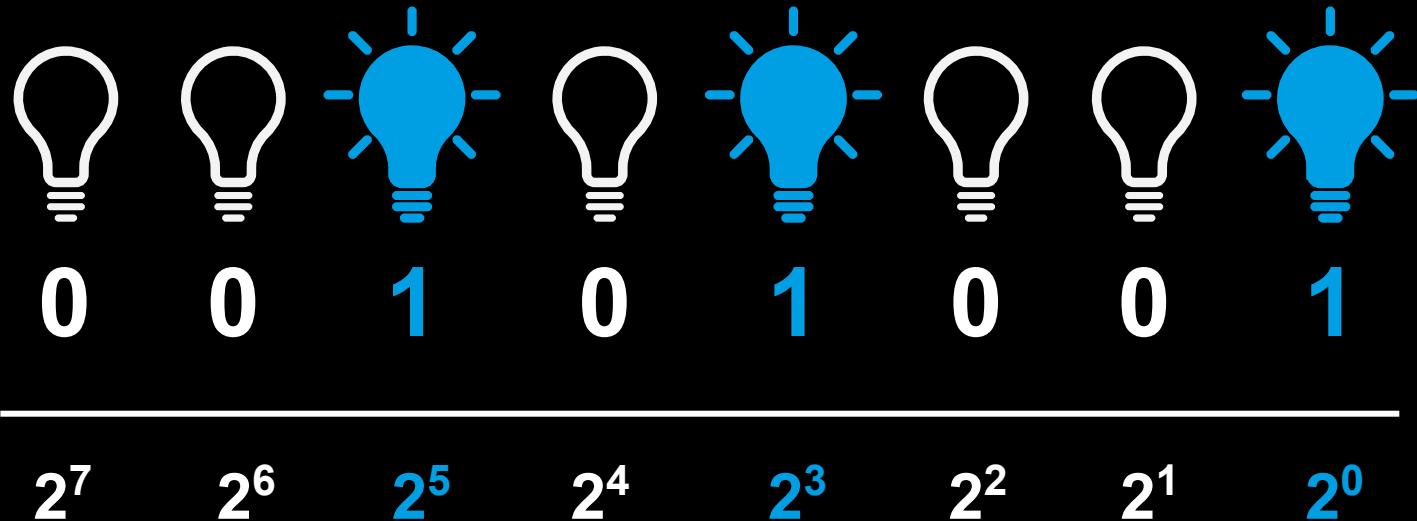

a **bit** (binary digit)

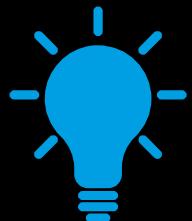

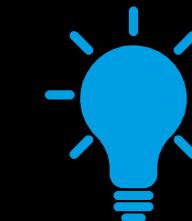

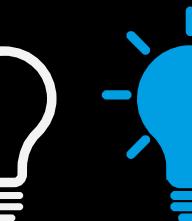

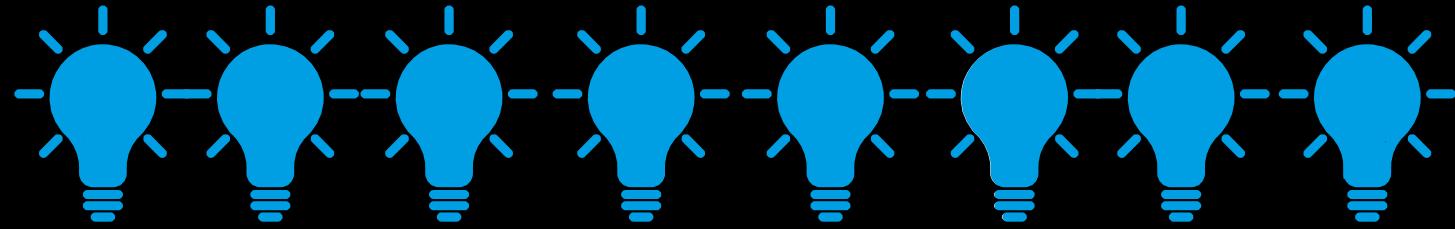

a **bit** (binary digit)

{

a **byte** (8 bits)

							
0	0	1	0	1	0	0	1
<hr/>							
2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0
128	64	32	16	8	4	2	1

what can we store in one byte?

what comes after the byte?

2^{10} bytes = 1.024 bytes = 1 Kibibyte (KiB)

2^{20} bytes = 1.048.576 bytes = 1 Mebibyte (MiB)

2^{30} bytes = 1.073.741.824 bytes = 1 Gibibyte (GiB)

10^3 bytes = 1.000 bytes = 1 Kilobyte (KB)

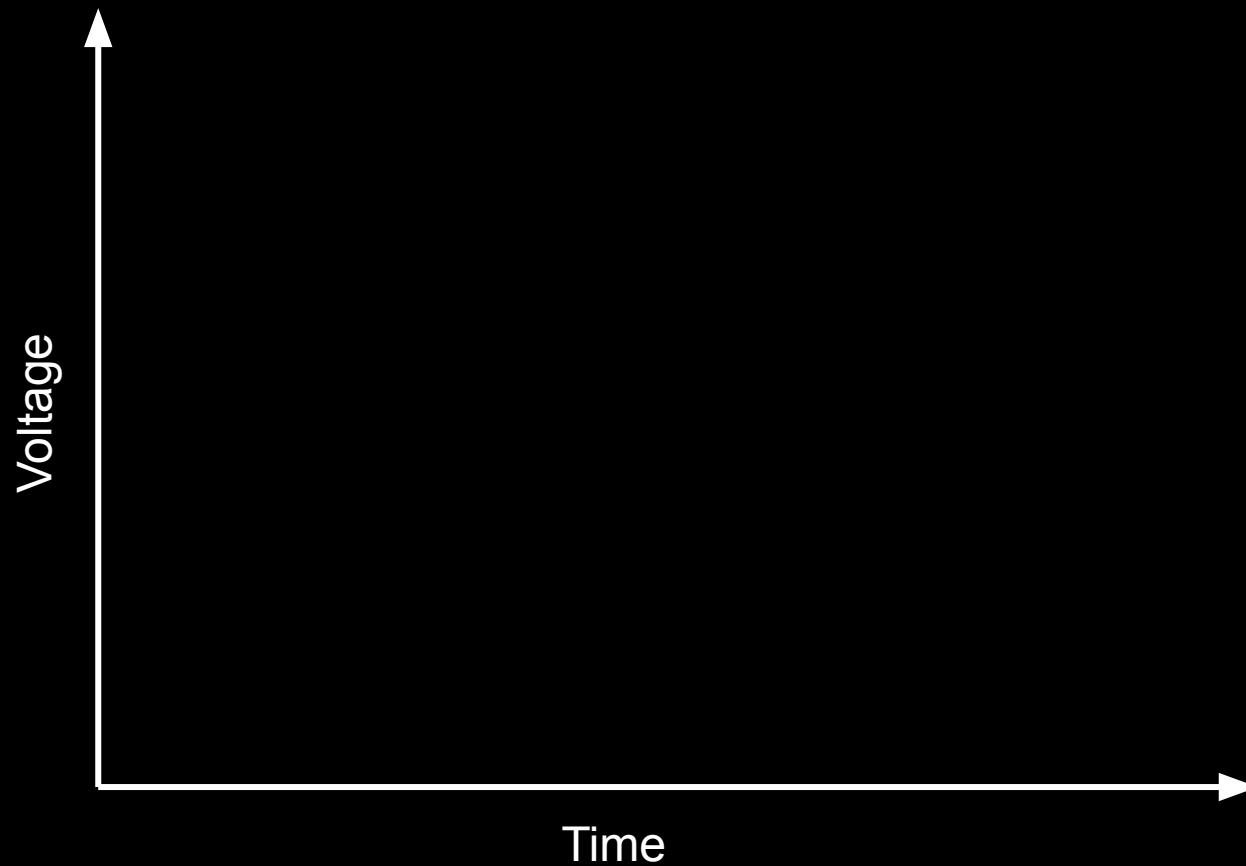

10^6 bytes = 1.000.000 bytes = 1 Megabyte (MB)

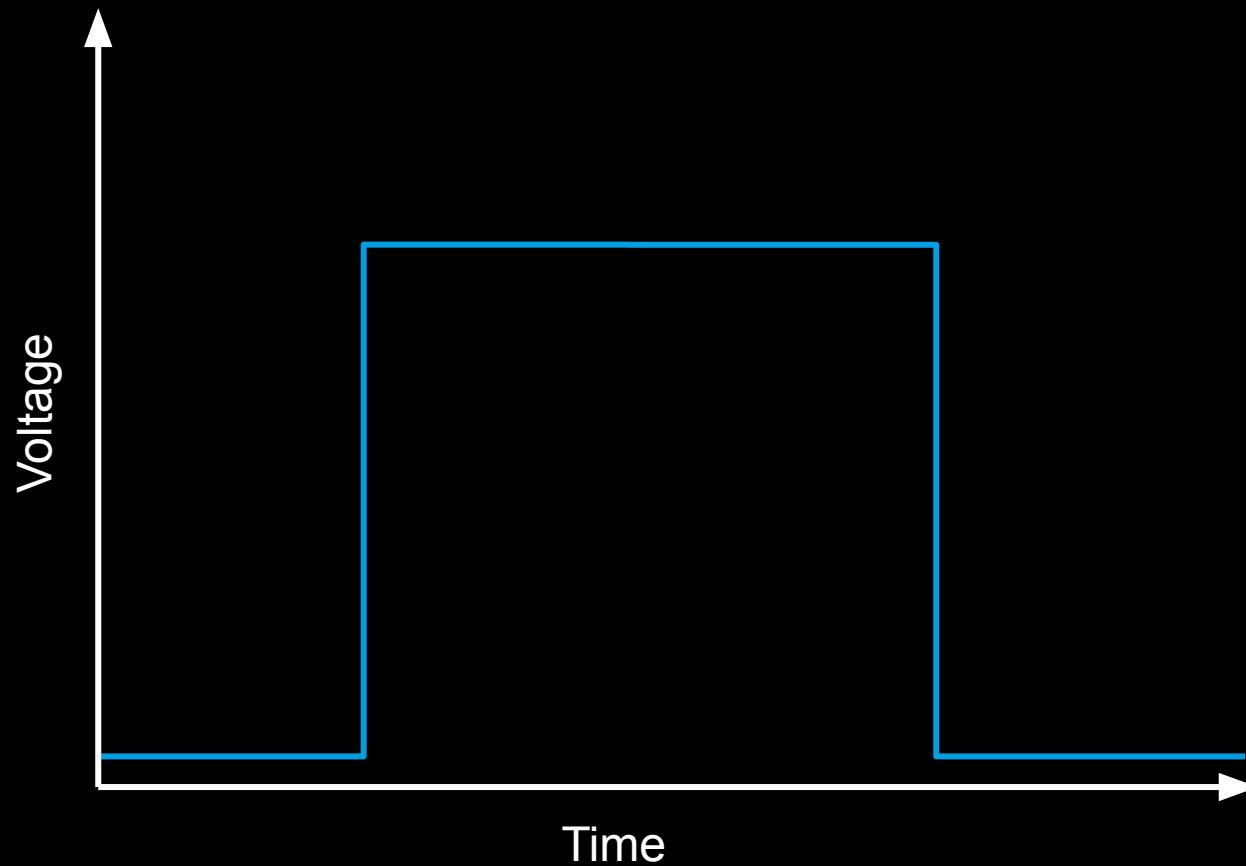

10^9 bytes = 1.000.000.000 bytes = 1 Gigabyte (GB)

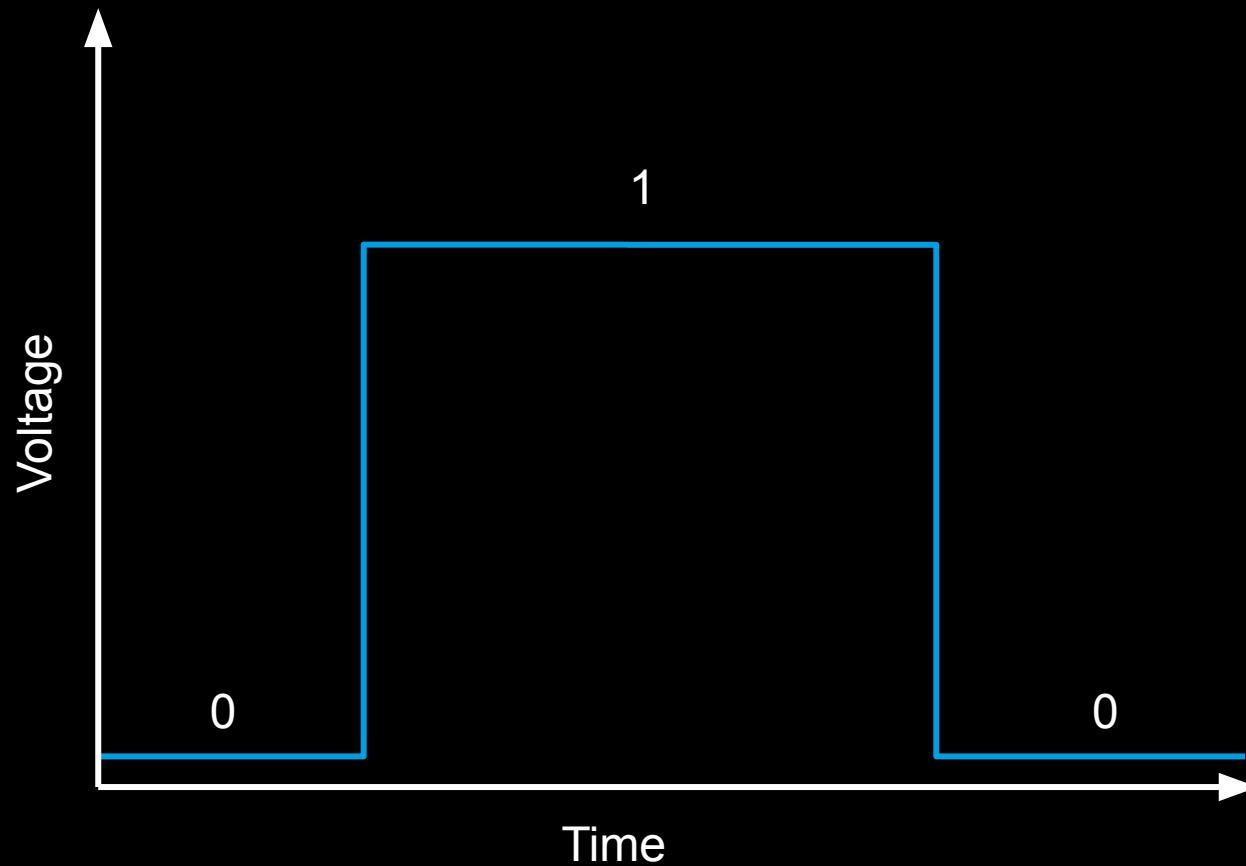

10^{12} bytes = ?

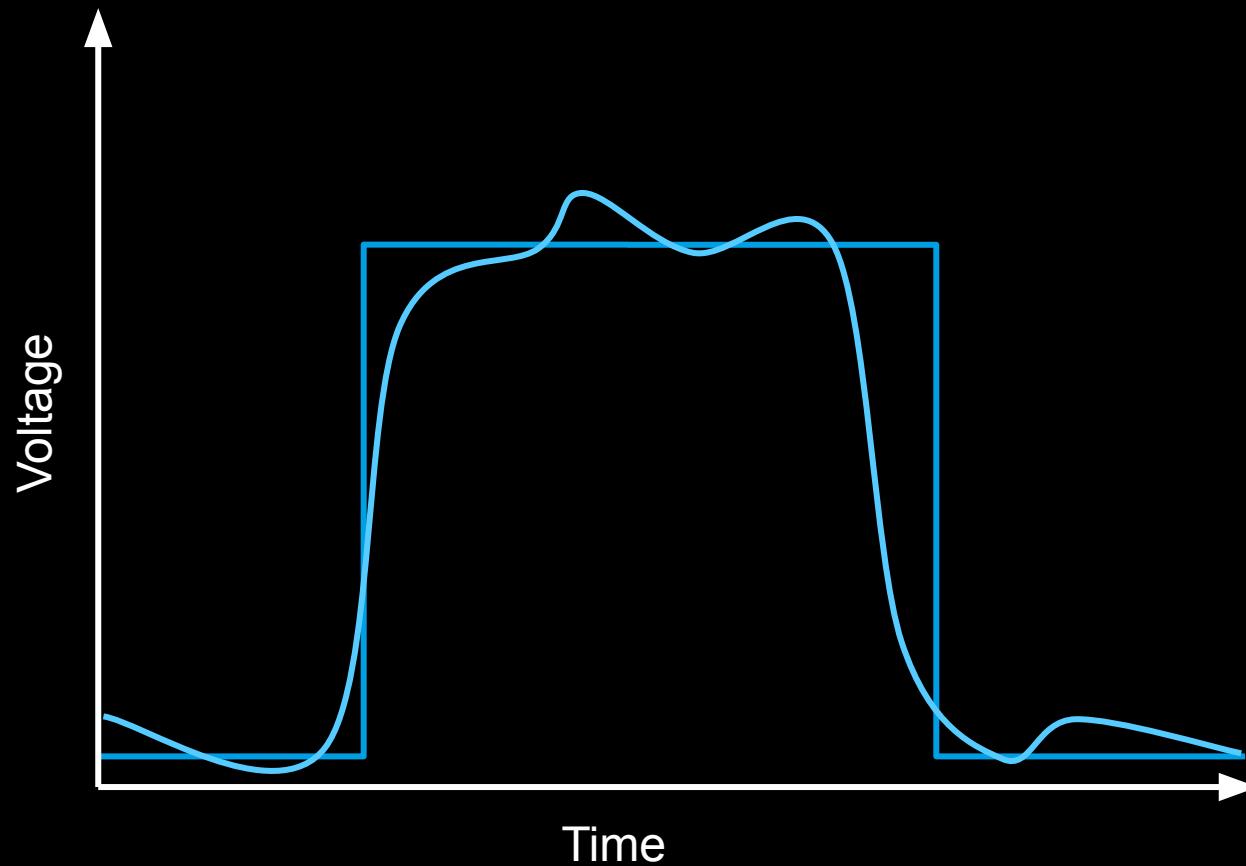

how many bits are on a DVD with
4.7 GB capacity?

are we stuck with binary?

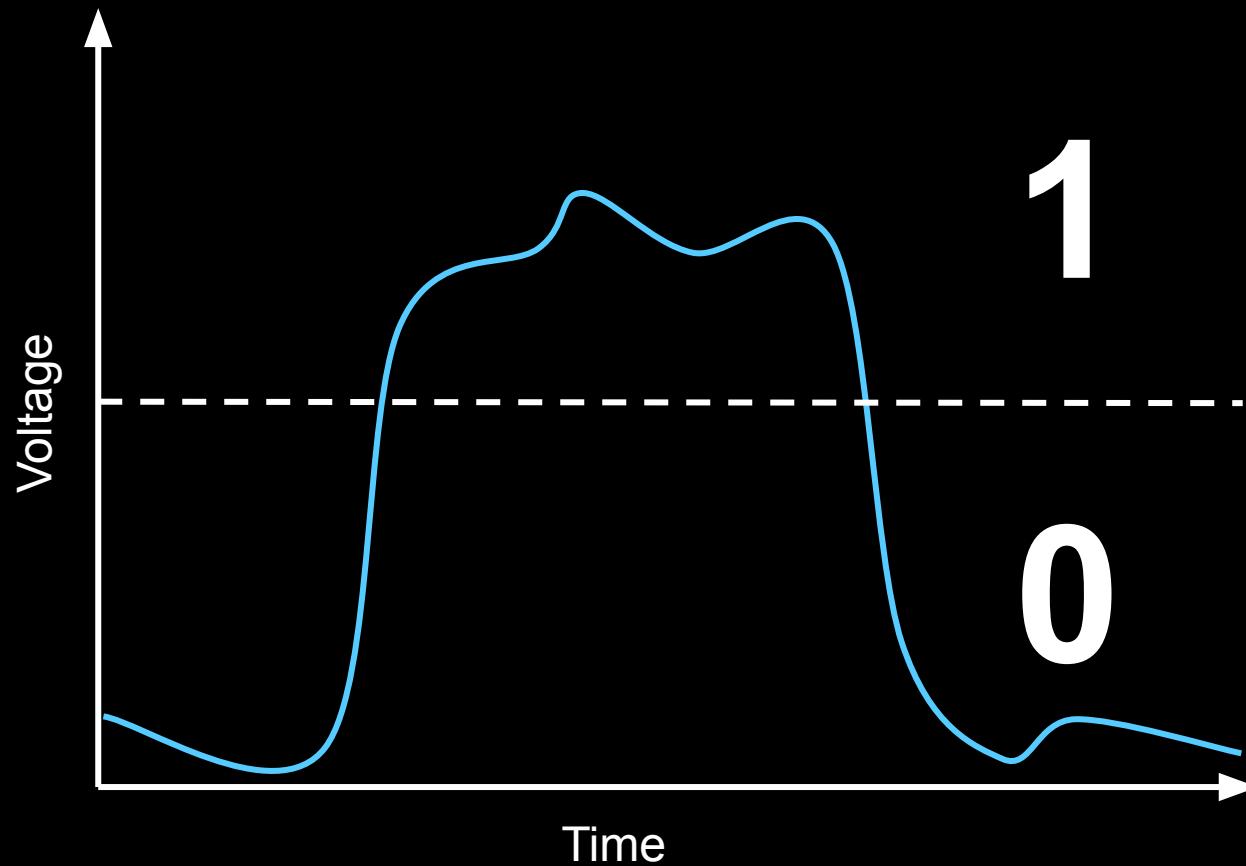

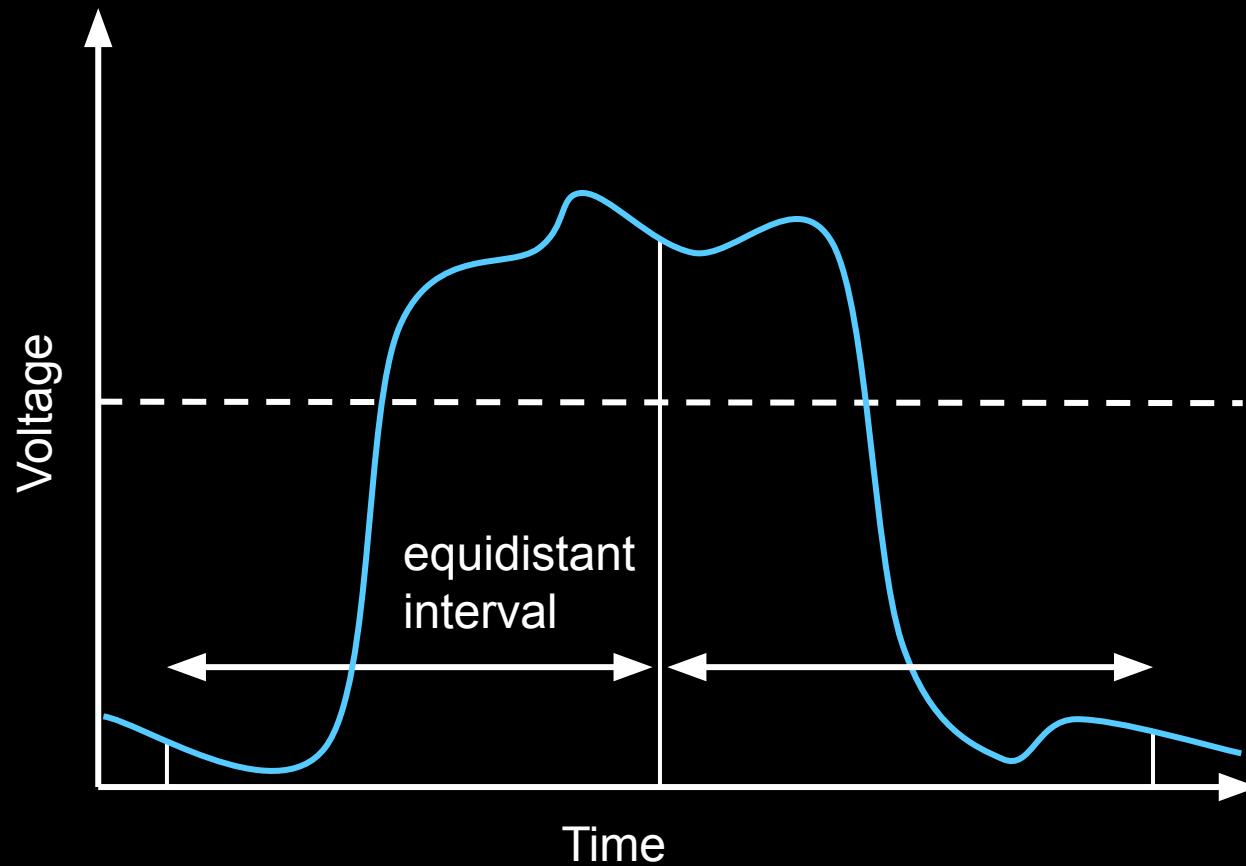

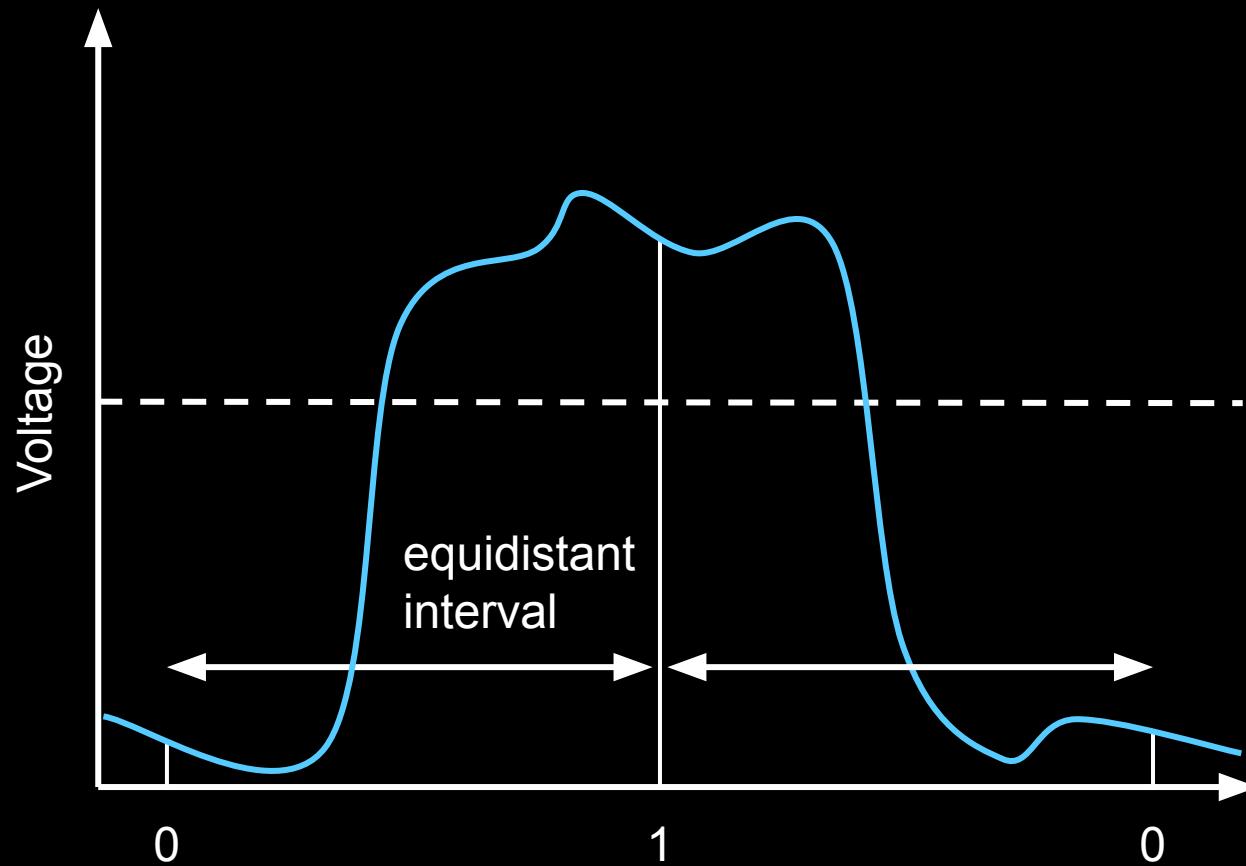

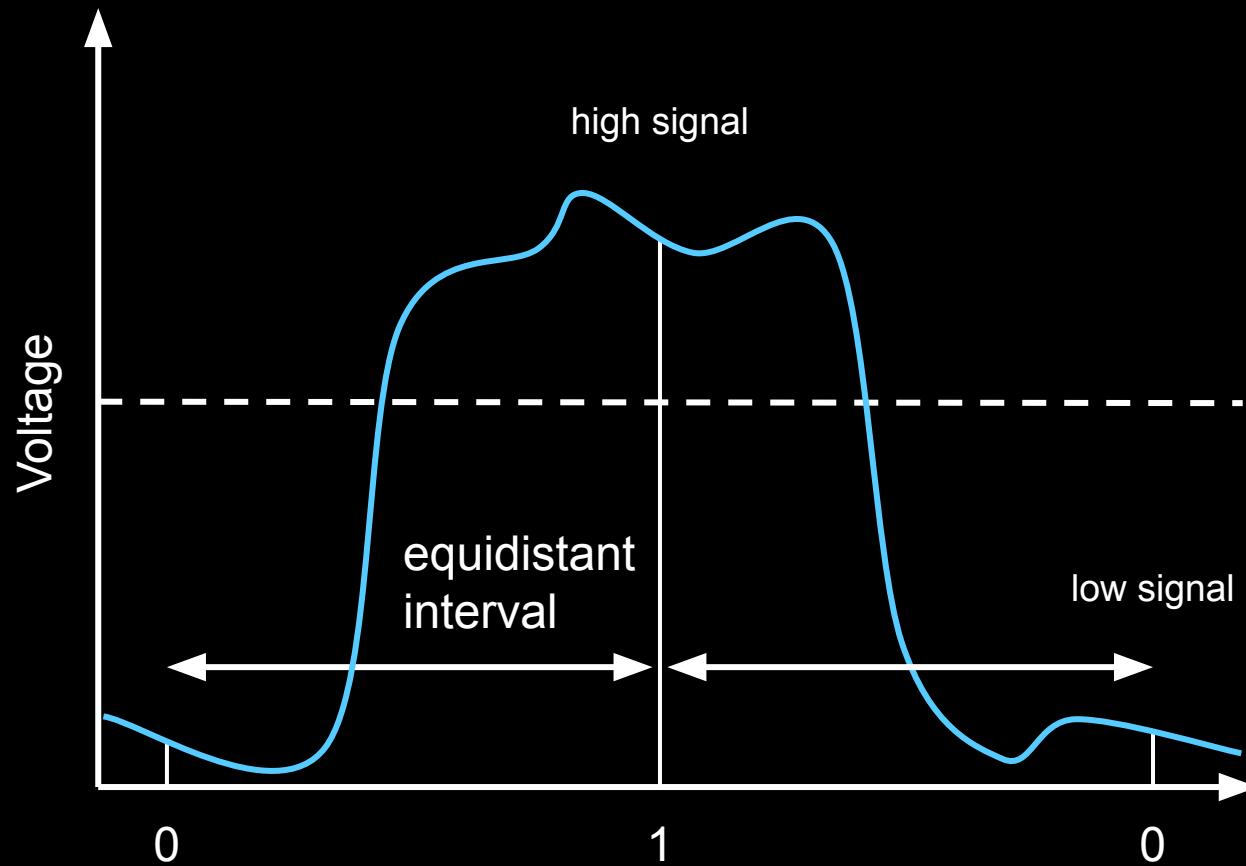

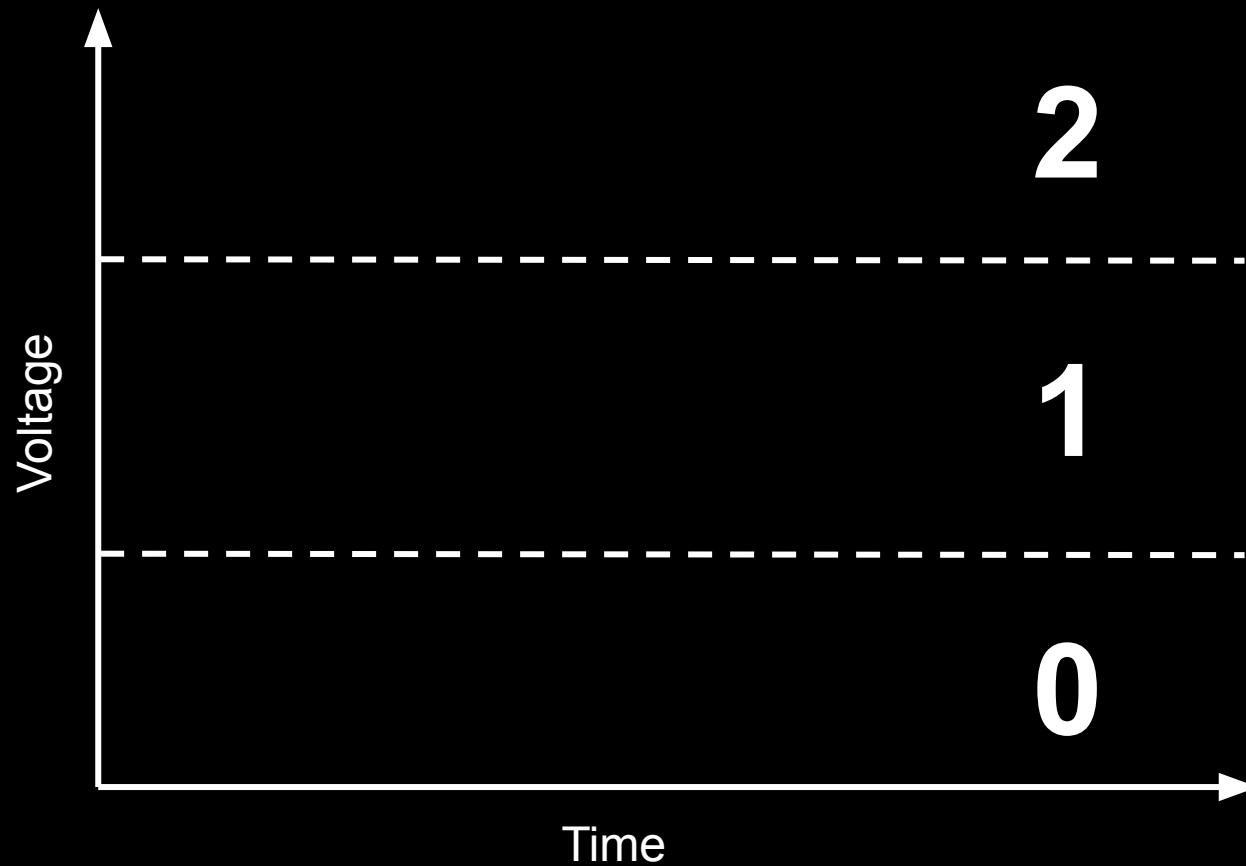

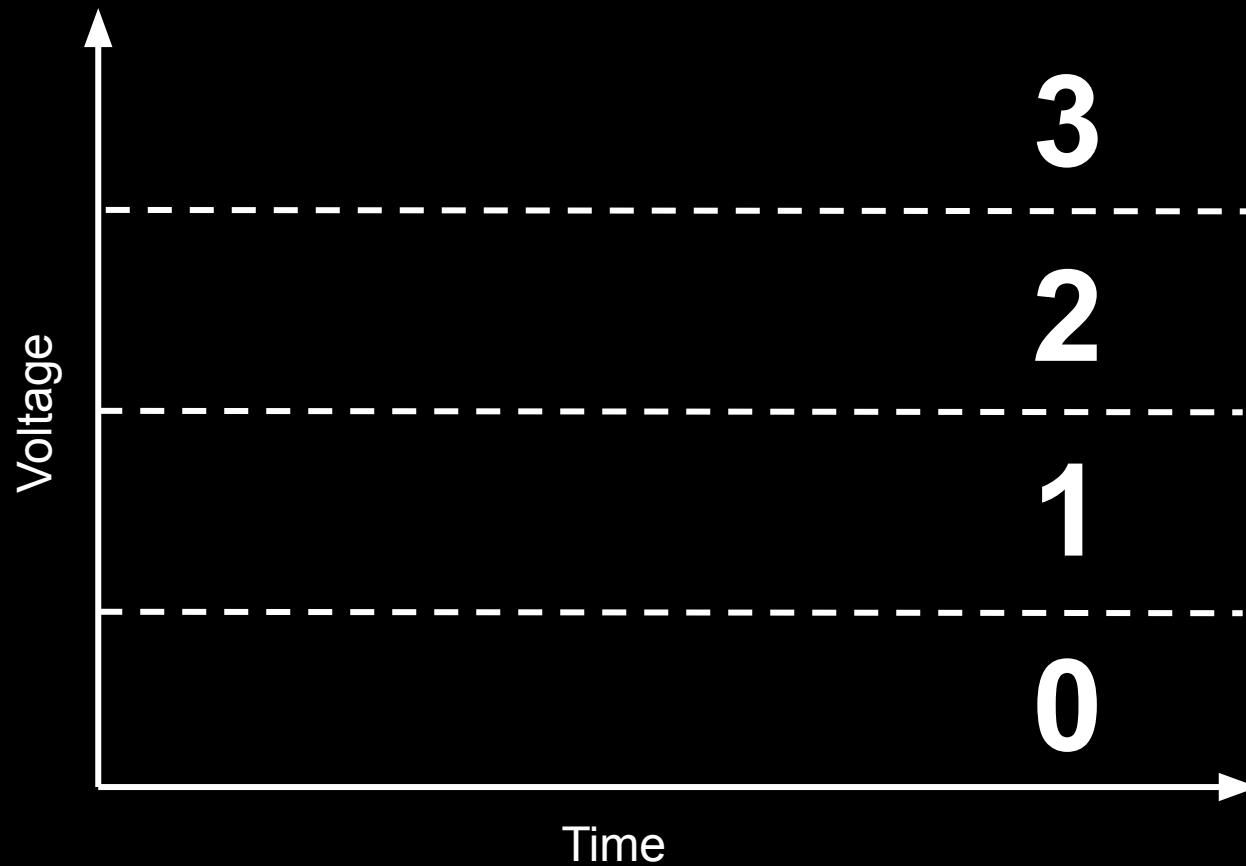

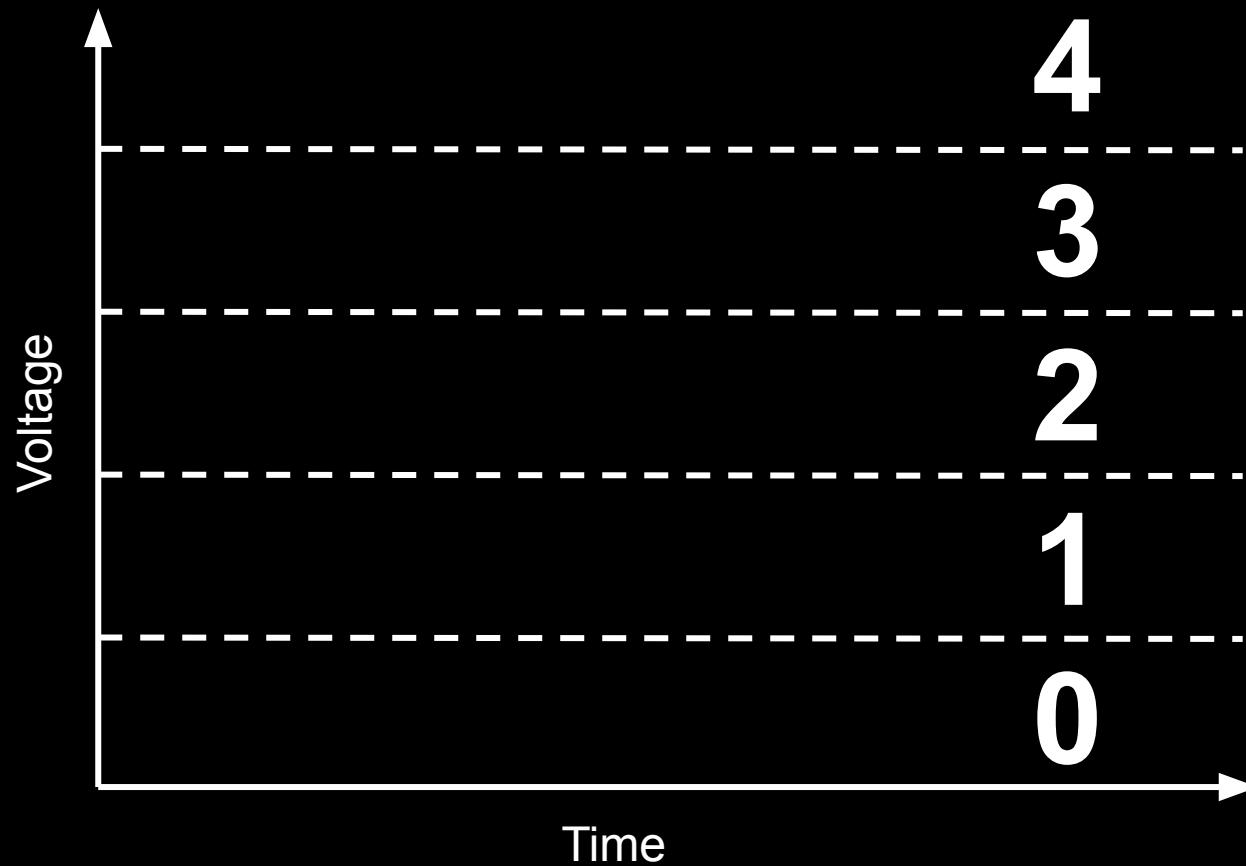

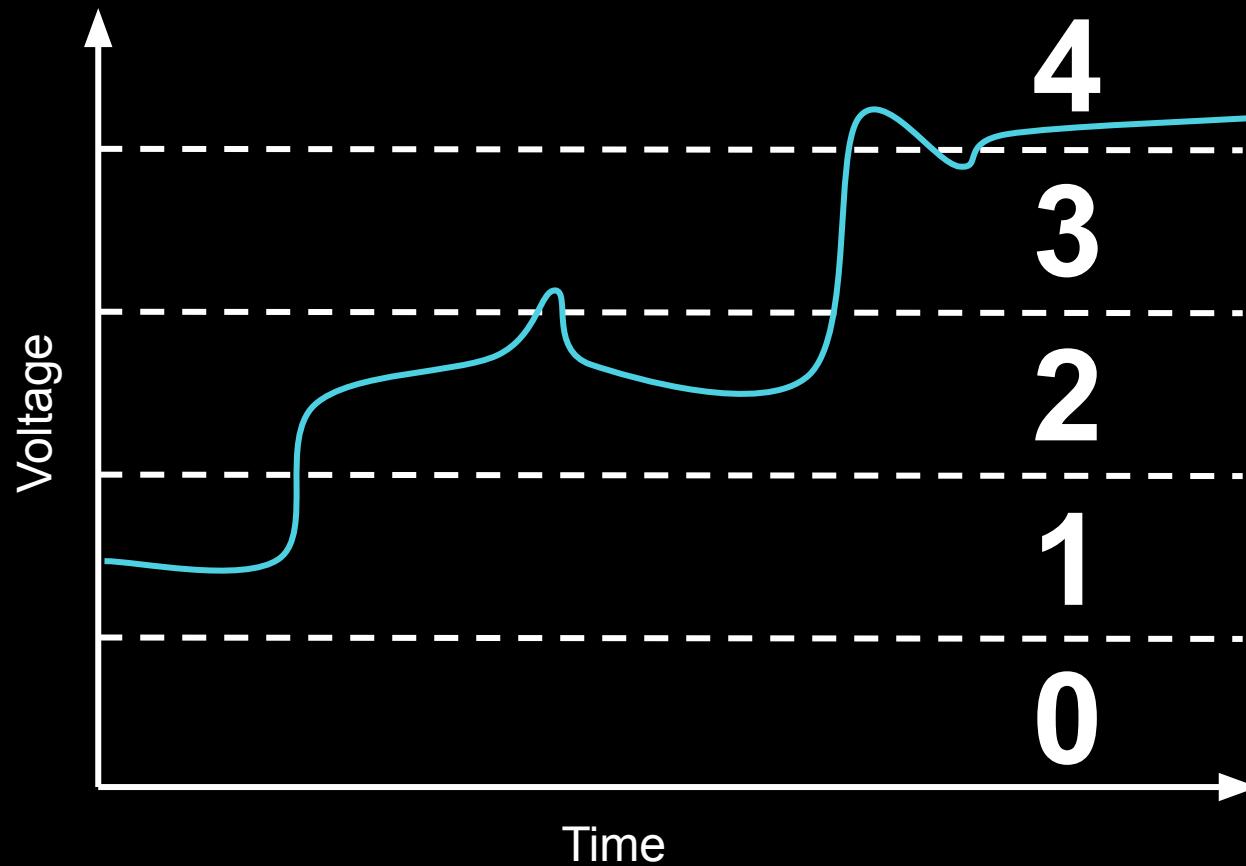

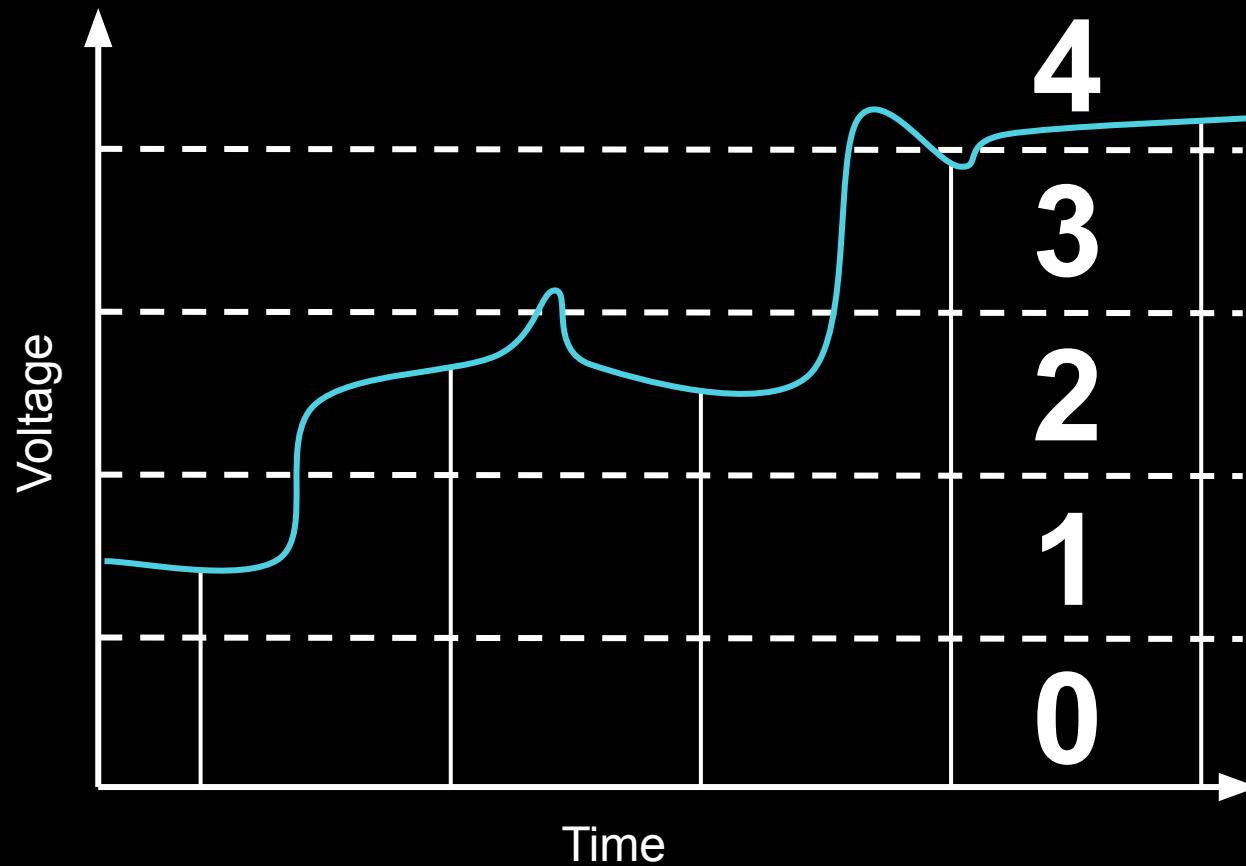

what about $R > 2$?

a higher base means less hardware

a higher base means less hardware
but more complex devices

a higher base means less hardware
but more complex devices
and more errors

“Digitization is the representation of an object, image, sound, document or signal by generating a series of numbers that describe a discrete set of its points or samples”

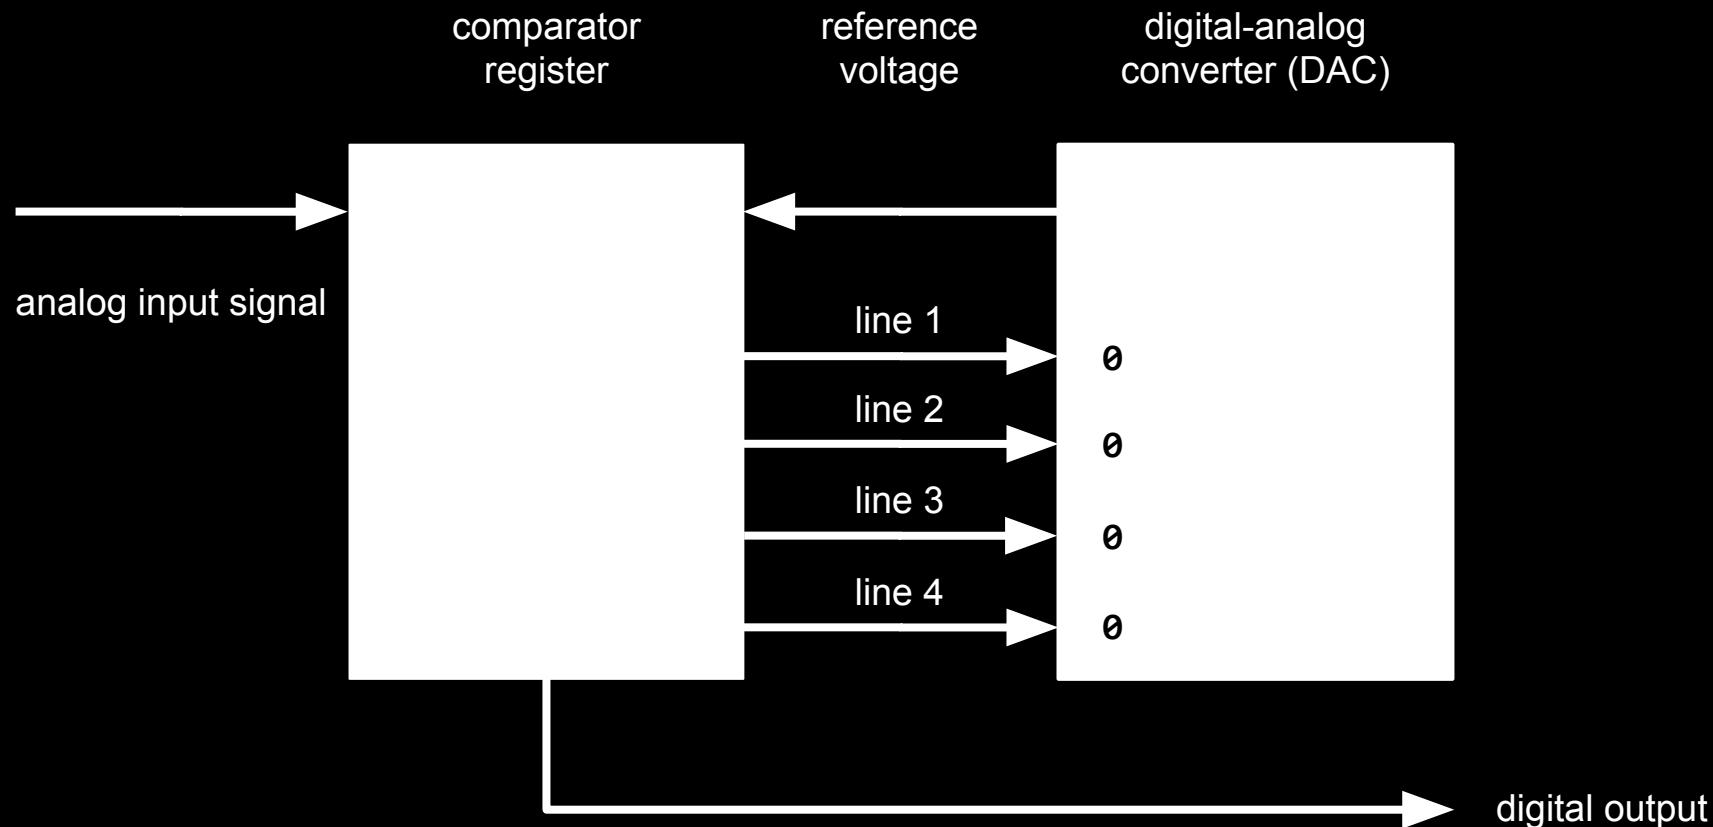

analog-to-digital converter (ADC)

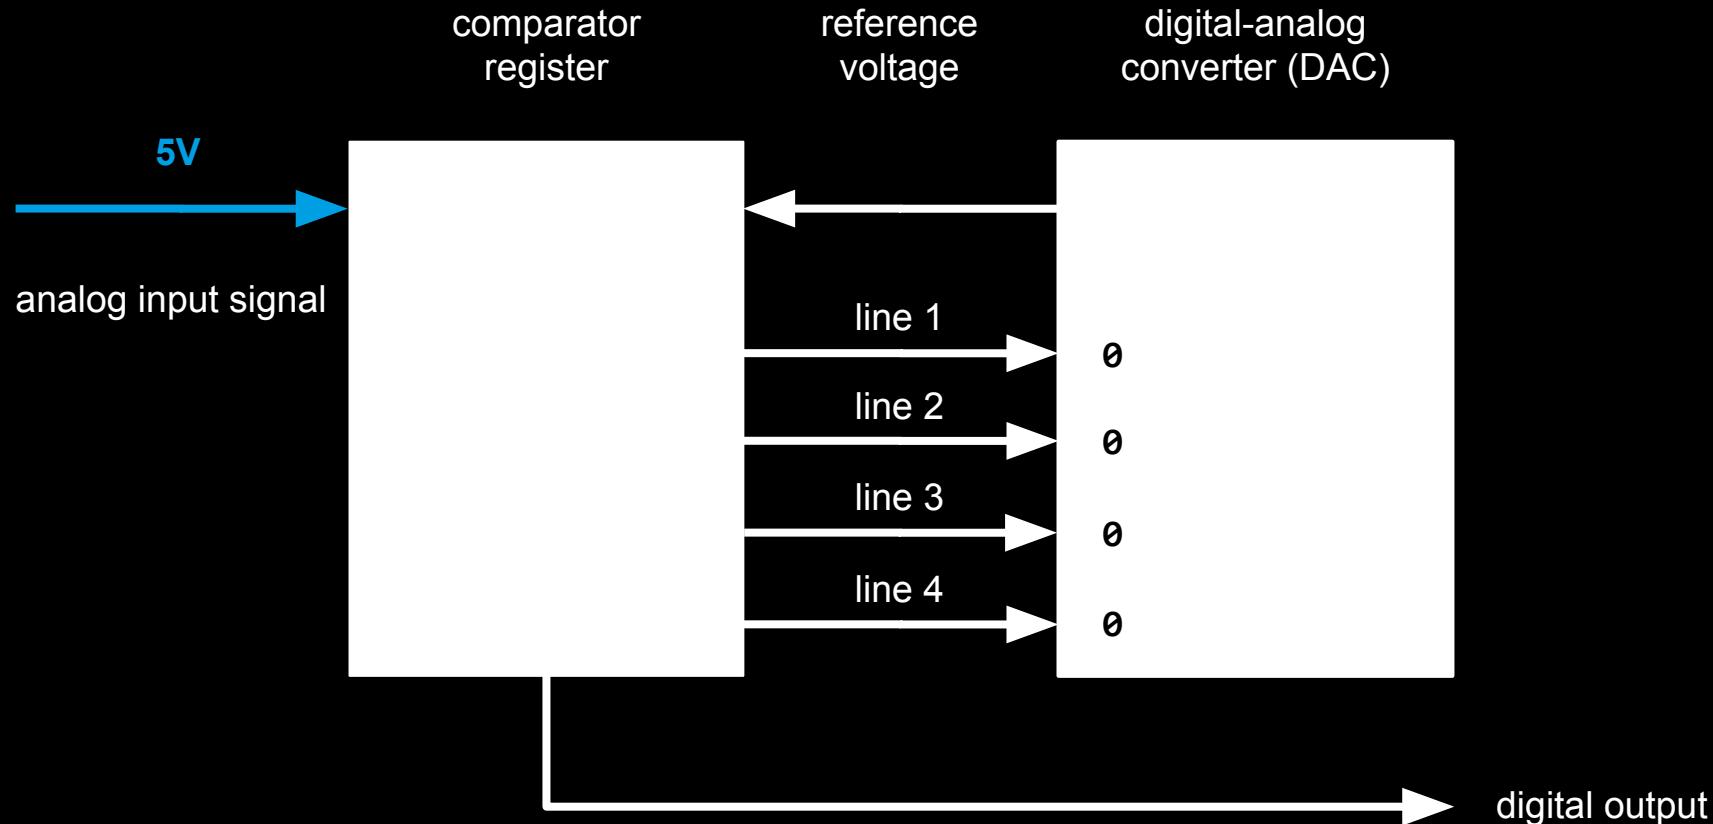

measuring of the
analog signal

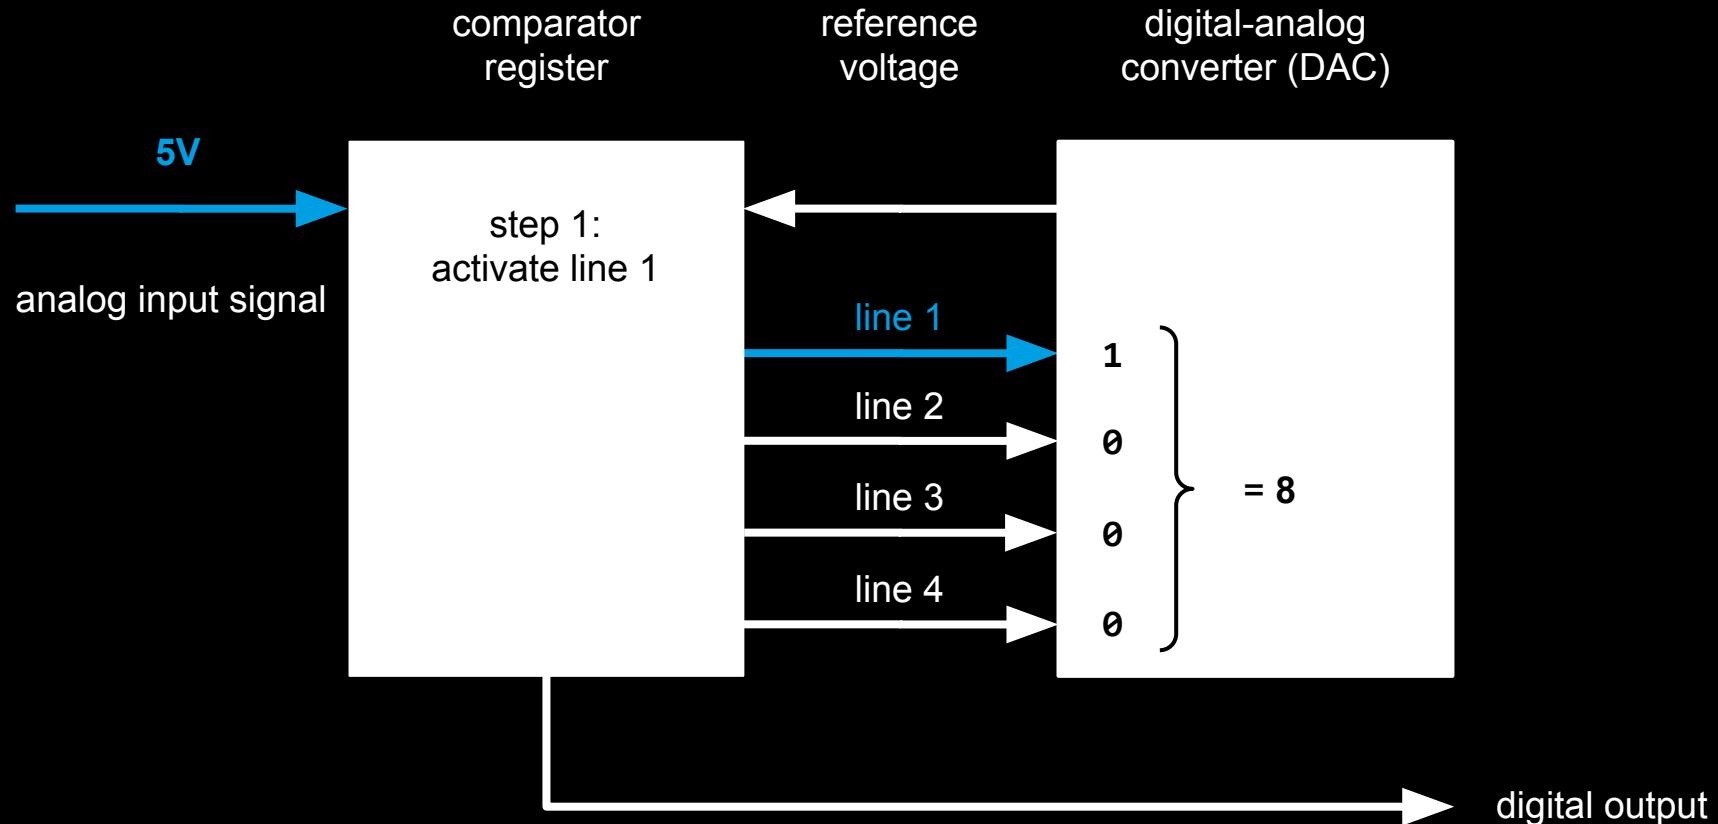

turning the
measurement into a
series of 1 and 0

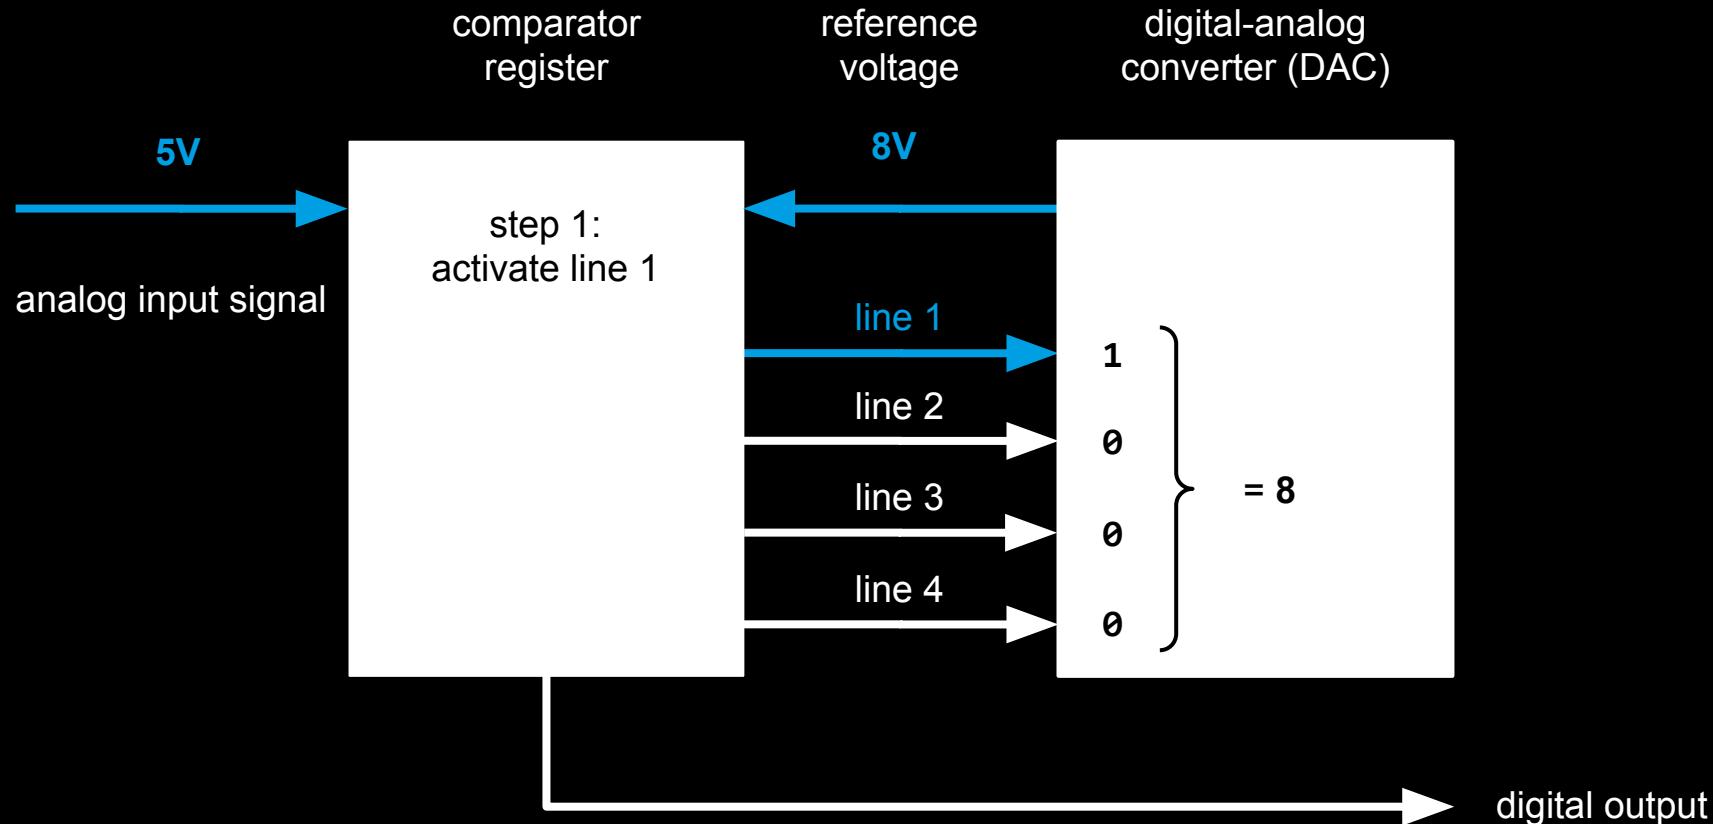

encoding the series of
numbers in binary
and assign meaning

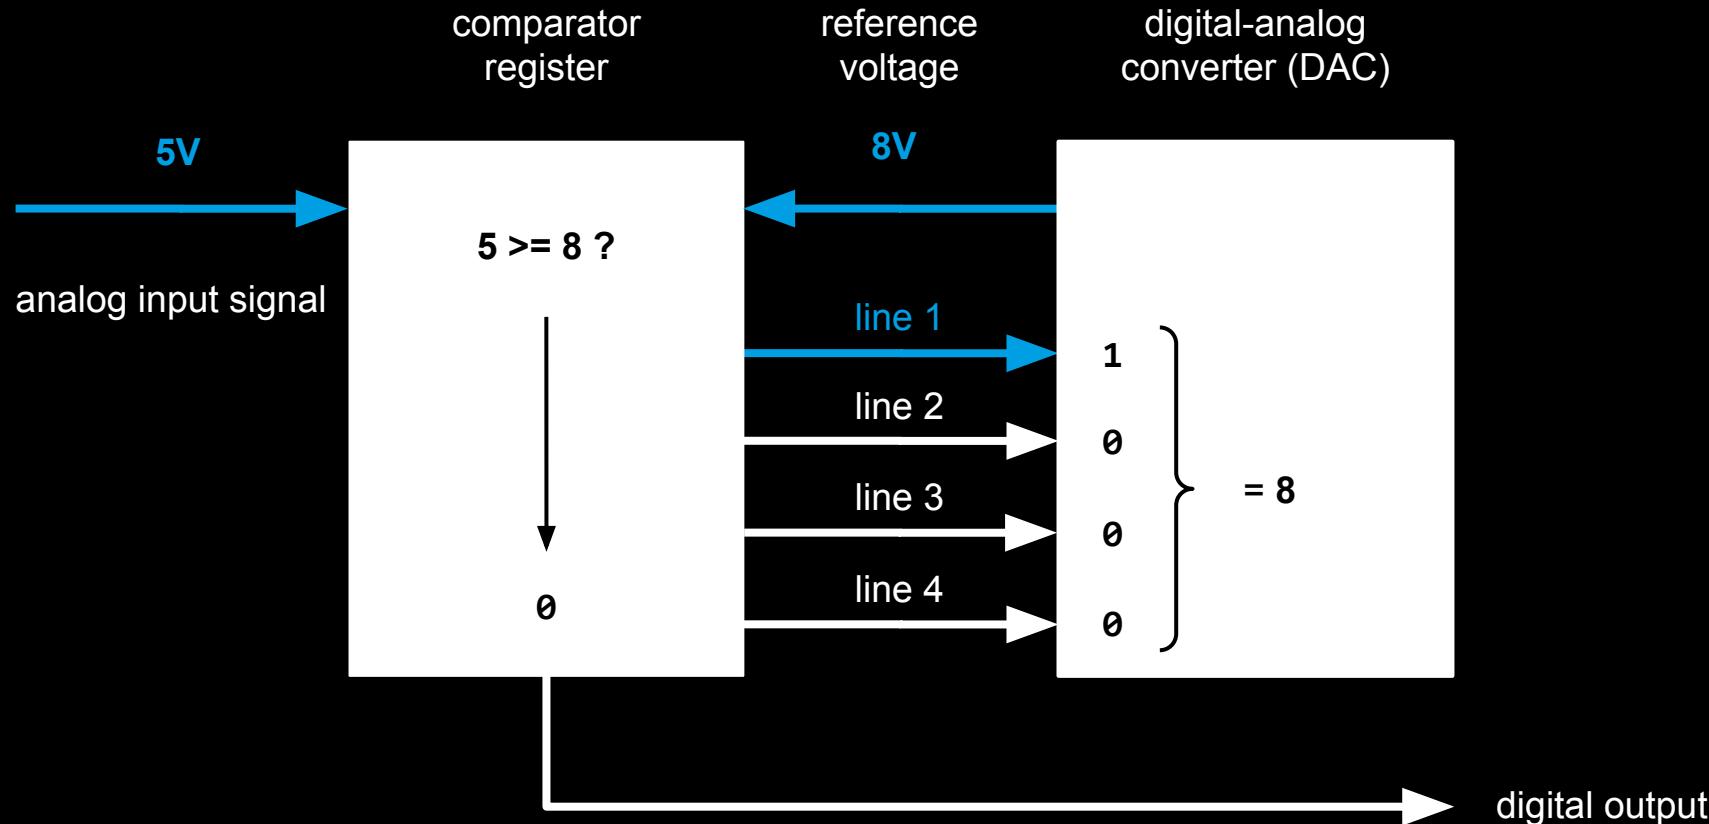

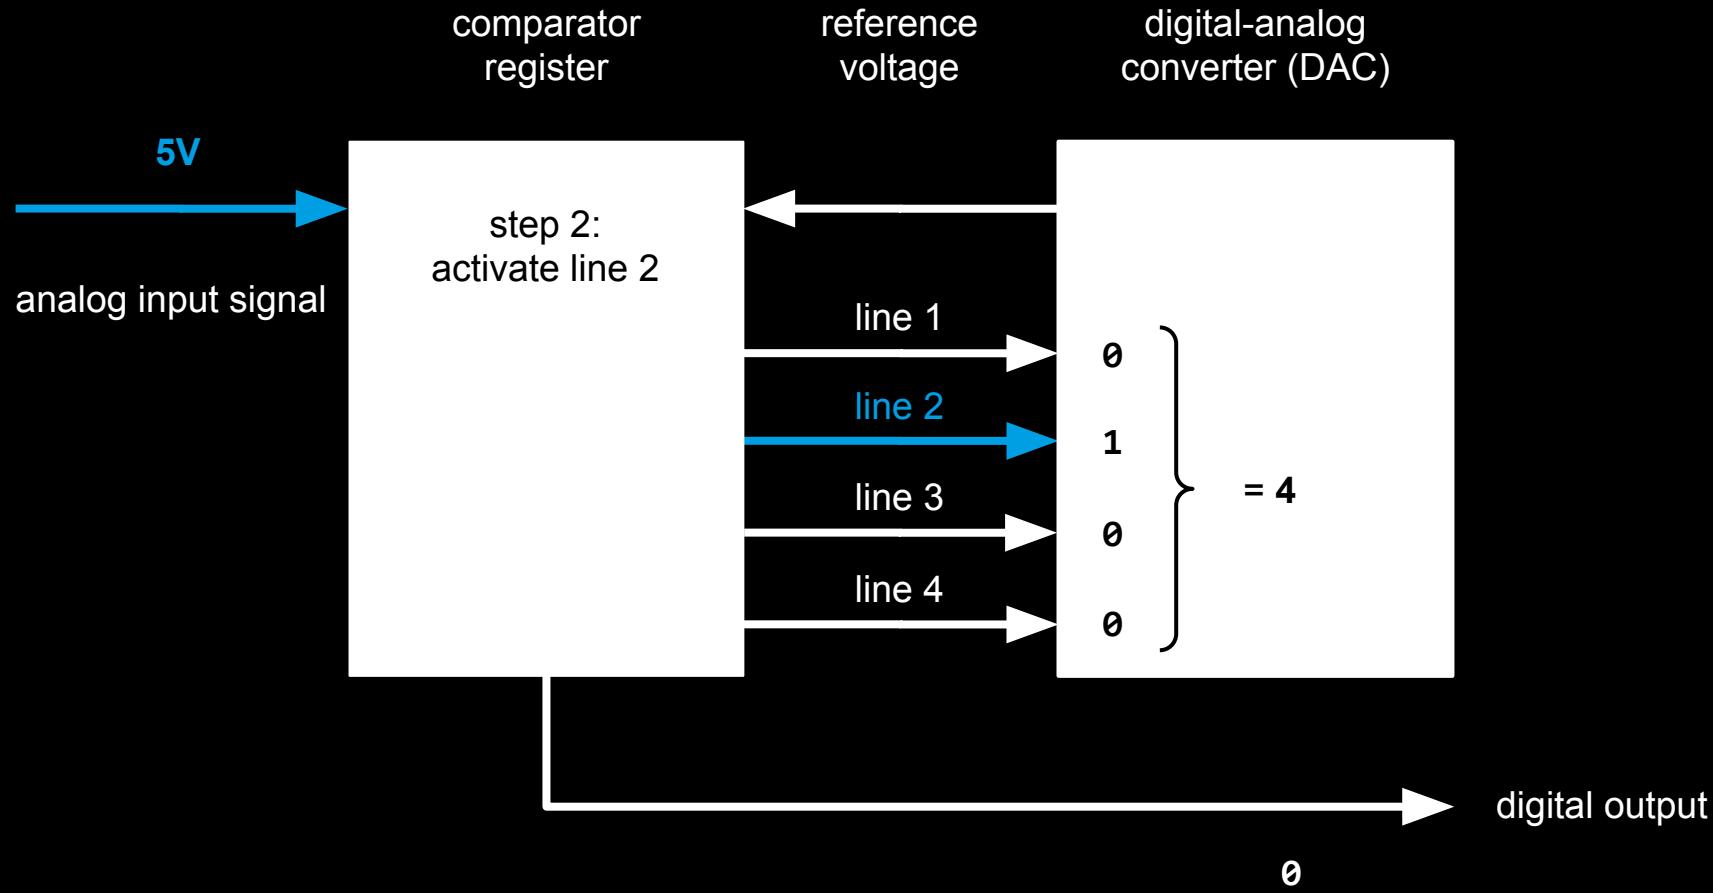

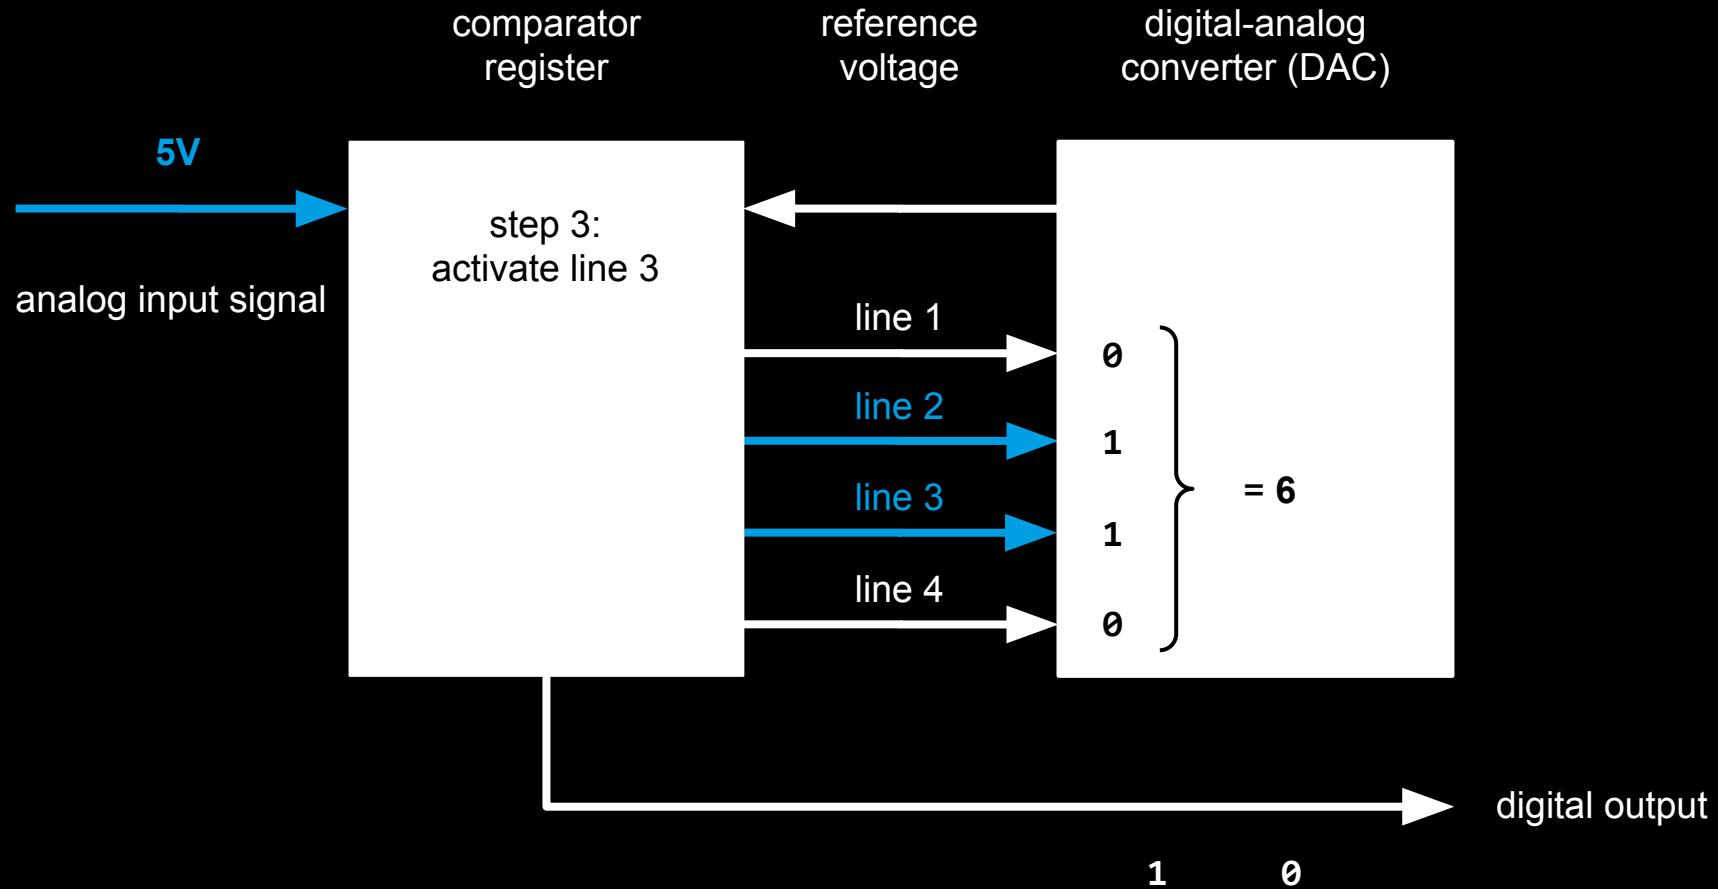

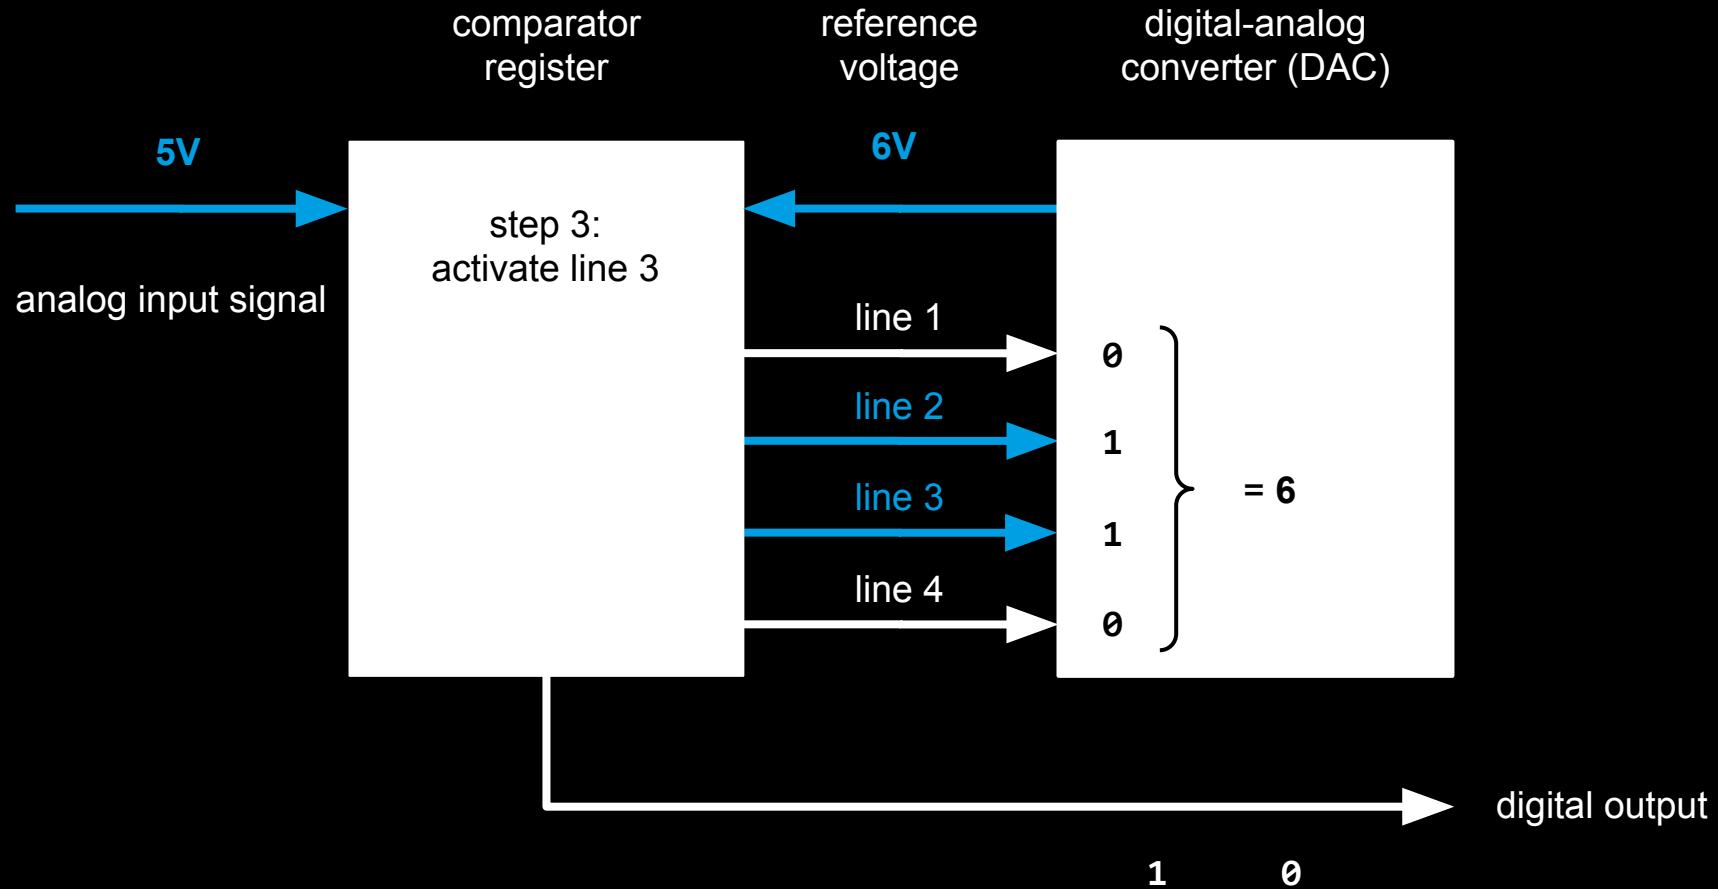

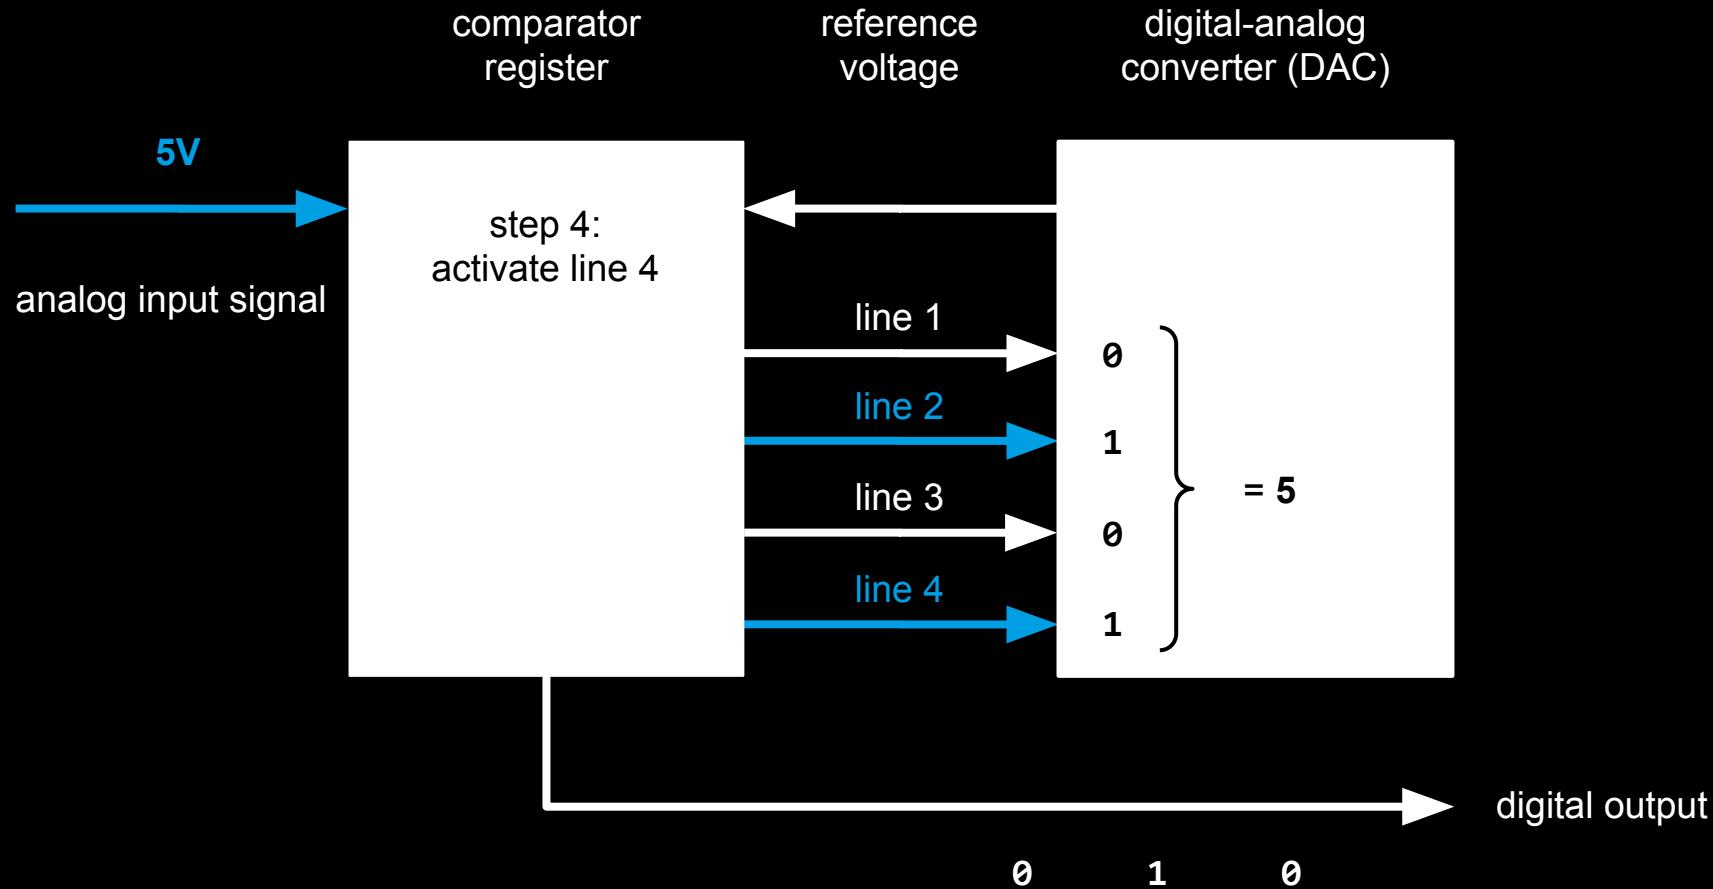

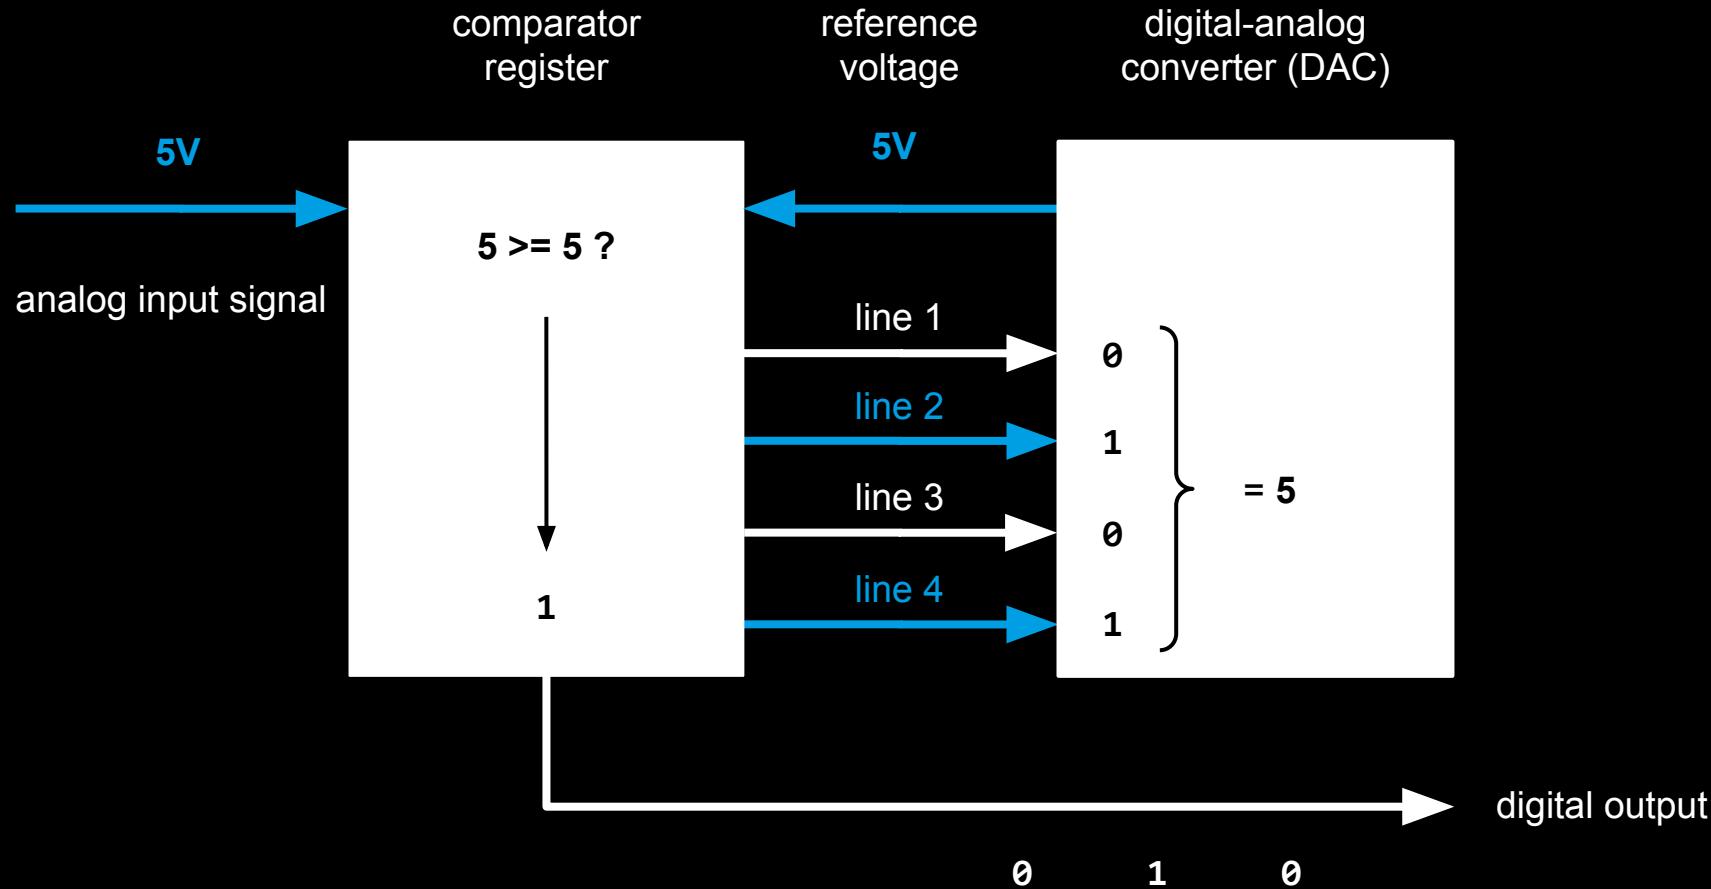

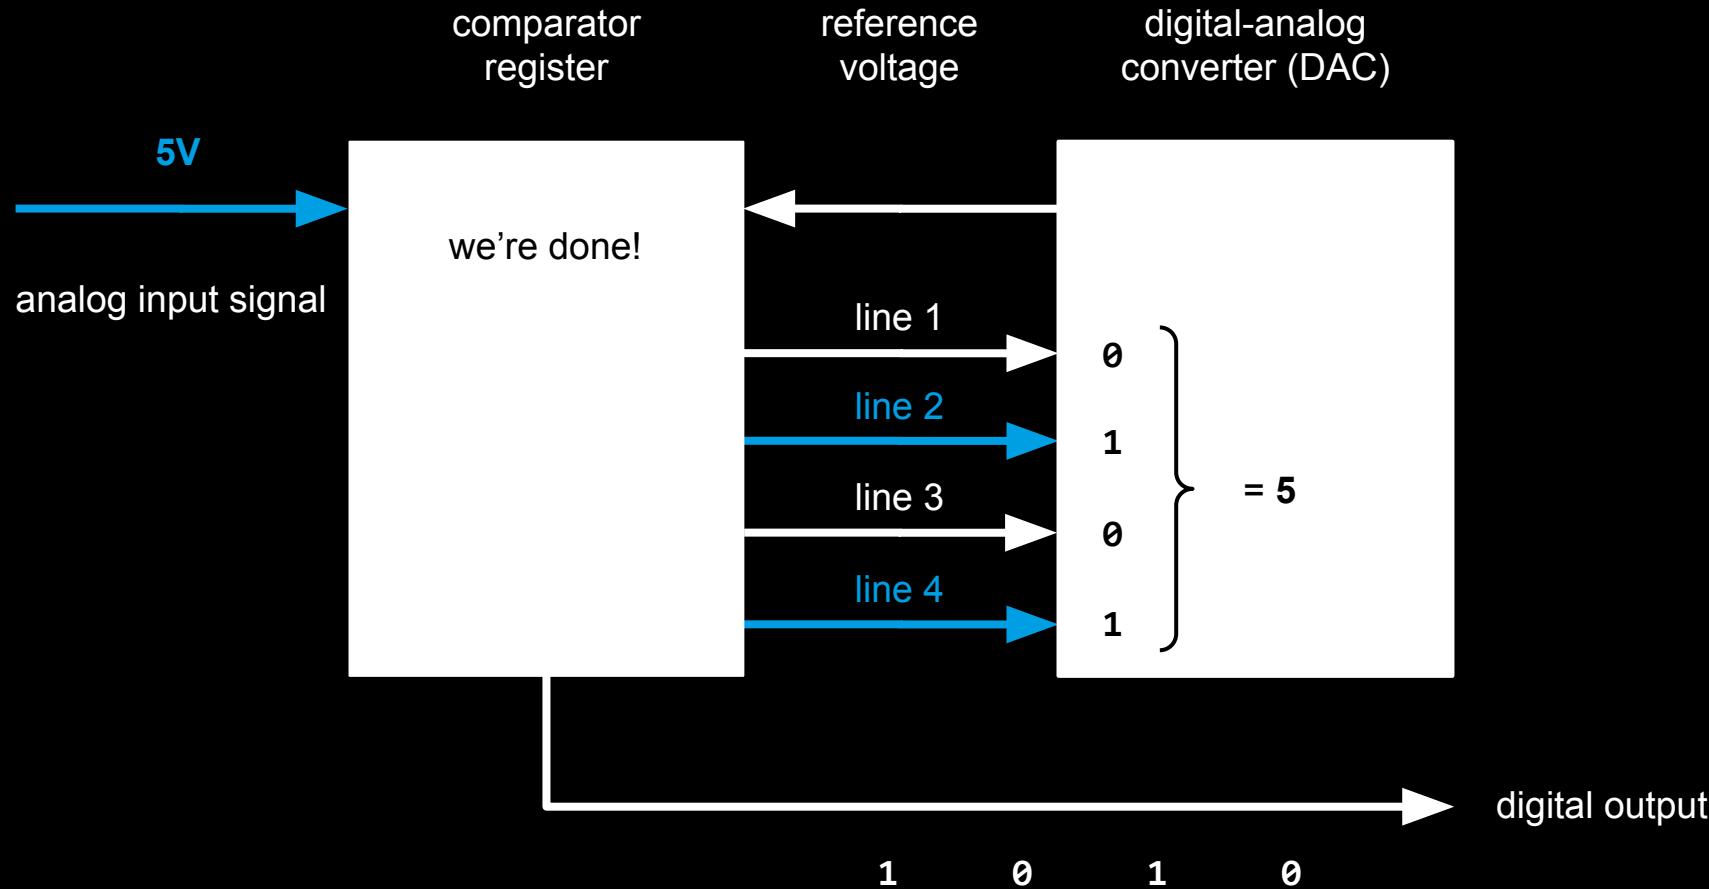

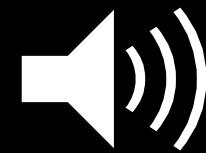

so, what analog signal is measured?

A **continuous** wave is transformed into an array of **discrete numbers** representing pressure.
