## **Exercise: Find and build the plot**

## **Preparation**

Load the data set containing the Campusbier orders:

```
library(tidyverse)
orders <- read_csv("data/orders.csv")</pre>
```

The focus of this task is to identify one or more suitable visualization types and build them with R and {ggplot2}. Don't bother too much with details of the plot's appearance, such as titles, colors, fonts or labels! Make it work, then make it nice (if you have time)!

## Task 1: Find a suitable plot and build it with {ggplot2}

- 1. Visualize the distribution of the order's total price:
  - For all orders in a single plot
  - Distinguished by the customer's gender
- 2. How is the time between the creation and closing of an order distributed?
- 3. Find a suitable plot to show the proportions of payment type usage!
- 4. Visualize the sales by week:
  - For the year 2021 only!
  - For the whole time span available!
- 5. Visualize the amount we lost per discount code!
- 6. Visualize when customers order during the day (hour) and compare weekends with weekdays in one plot!
- 7. Find a visual representation of our top 10 customers by turnover?

- 8. Who is more open to marketing emails: University staff or other people? Find a suitable visual display!
- 9. Do iPhone or Android users spent more money per order?
- 10. Find a suitable visualization to quickly identify the hotspot order time slote during the week! When should we careful not to perform any shop maintenance?
